SYSTEMS INTERCHANGE MODIFICATION REPORT

I-95/State Road (SR) 9 Project Development and Environment (PD&E) Study
From South of SR 860/Miami Gardens Drive to North of Broward County Line
Miami-Dade County, Florida

Financial Management Number: 414964-1-22-01
Federal Aid Project Number: N/A
Efficient Transportation Decision Making (ETDM): 14419

DISTRICT VI

The environmental review, consultation, and other actions required by applicable federal environmental laws for this project are being, or have been, carried out by the Florida Department of Transportation (FDOT) pursuant to 23 U.S.C. § 327 and a Memorandum of Understanding dated May 26, 2022 and executed by the Federal Highway Administration and FDOT.

SYSTEMS INTERCHANGE MODIFICATION REPORT (SIMR)
DETERMINATION OF SAFETY, OPERATIONAL AND ENGINEERING ACCEPTABILITY

Study Information:
SR 9/I-95 from South of SR 860/Miami Gardens Drive to North of Broward County Line
Systems Interchange Modification Report (SIMR)
FM 414964-1-22-01

Acceptance of this document indicates successful completion of the review and determination of safety, operational and engineering acceptability of the Interchange Access Request. Approval of the access request is contingent upon compliance with applicable Federal requirements, specifically the National Environmental Policy Act (NEPA) or Department's Project Development and Environment (PD&E) Procedures. Completion of the NEPA/PD&E process is considered approval of the project location design concept described in the environmental document.

Requestor	Auraliz Benitez, PE *FDOT District 6 – Project Manager*	*Date*
Interchange Review Coordinator	Ken Jeffries *FDOT District 6 – Transportation Planning Manager*	*Date*
Systems Management Administrator	Joshua A Jester, PE *Central Office – Systems Implementation Office*	*Date*
Chief Engineer of Production	Jennifer Marshall, PE *Central Office*	*Date*

QUALITY CONTROL CERTIFICATION FOR INTERCHANGE ACCESS REQUEST SUBMITTAL

Submittal Date: March 10, 2025

FM Number: 414964-1-22-01

Project Title: SR 9/I-95 from South of SR 860/Miami Gardens Drive to North of Broward County Line SIMR

District: Six

Requestor: Auraliz Benitez, PE Phone: (305) 470-5471

District IRC: Ken Jeffries Phone: (305) 407-5445

Document Type: ☐ MLOU ☐ IJR ☐IMR ☐IOAR ☑ OTHER SIMR

Status of Document (Only complete documents will be submitted for review; however, depending on the complexity of the project, interim reviews may be submitted as agreed upon in the MLOU)

Draft Submittal

Quality Control (QC) Statement

This document has been prepared following FDOT Procedure Topic No. 525-030-160 (New or Modified Interchanges) and complies with the FHWA two policy requirements. Appropriate District level quality control reviews have been conducted and all comments and issues have been resolved to their satisfaction. A record of all comments and responses provided during QC review is available in the project file or Electronic Review Comments (ERC) system.

Requestor _____ Date: _____
Auraliz Benitez, PE

IRC _____ Date: _____
Ken Jeffries

ENGINEER'S CERTIFICATION

I, John Arrieta, PE # 61370, certify that I currently hold an active Professional Engineer's License in the State of Florida; and I am competent through education or experience to provide engineering services in the civil and traffic engineering disciplines contained in this report. I also certify that I provide these services under, the firm Colliers Engineering & Design, Inc., which holds Vendor Number F22-2651610-001 from the Florida Department of Transportation. I further certify that this report was prepared by me or under my responsible charge as defined in Chapter 61G15-18.011 F.A.C. and that all statements, conclusions, and recommendations made herein are true and correct to the best of my knowledge and ability.

EXECUTIVE SUMMARY

This Systems Interchange Modification Report (SIMR) is being prepared as part of the Project Development & Environment (PD&E) to address the proposed improvements at the SR 9/I-95 corridor from south of SR 860/Miami Gardens Drive to north of Broward County Line. This project entails potentially providing additional express and/or general use lanes on SR 9/I-95, from south of SR 860/Miami Gardens Drive Interchange (MP 13.724) to Broward County Line (MP 17.199), in Miami-Dade County, Florida. This project also assesses improvements at the SR 9/I-95 interchanges with SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road.

The purpose of this project is to address the deficient operational capacity and relieve existing/future congestion along the SR 9/I-95 corridor and its interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, which in turn will improve safety and reduce travel time. Other goals of the project are 1) to preserve the operational integrity and regional functionality of SR 9/I-95 (and, therefore, the regional transportation network) by providing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties and 2) to enhance emergency evacuation and response times.

It is in the national interest to preserve and enhance the Interstate System to meet the needs of the 21st Century by assuring that it provides the highest level of service in terms of safety and mobility. Full control of access along the Interstate mainline and ramps, along with control of access on the crossroad at interchanges, is critical to providing such service. Therefore, the Federal Highway Administration's (FHWA) decision to approve new or revised access points to the Interstate System under Title 23, United States Code (U.S.C.), Section 111, must be supported by substantiated information justifying and documenting that decision. The FHWA's decision to approve a request is dependent on the proposal satisfying and documenting the following requirements:

Policy Point 1

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, and ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (Title 23, Code of Federal Regulations (CFR), paragraphs 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The operational analysis conducted for this SIMR confirmed that the proposed interchange modifications for Build Alternative 3 are not expected to have any significant adverse impacts on safety and operations on the interstate facility, SR 9/I-95. When compared with the No-Build Alternative, the Build Alternative 3 improves or maintains operations along SR 9/I-95 mainline within the study interchange and connection to adjacent interchanges.

For Build Alternative 3, the freeway analysis results indicate that all the freeway segments in the study area will be able to serve 90% or more of the projected demand for all the segments in the southbound and northbound directions during the AM and PM peak hour periods. The analysis also indicates that both directions of the Express Lanes and the northbound direction of the General Use Lanes will operate uncongested during both peak hour periods. In addition, all southbound General Use Lane segments will be improved to indicate lightly congested operations. In contrast, under No-Build Alternative, the freeway analysis results indicate that most of the freeway segments in the study area will experience moderate or heavy congestion during one or both peak hour periods as defined by one of the MOEs, such as speed, density, or demand served. The available capacity will not be able to serve 90% or more of the projected demand for any of the segments in the southbound direction during either the AM or PM peak hour periods. Similarly, all southbound Express Lanes segments during the AM peak hour and southbound Express Lane segment 3 during the PM peak hour will not be able to serve 90% or more of the projected demand. .

The intersection analysis results for Build Alternative 1 indicate that the operations at SR 860/Miami Gardens Drive will deteriorate during both the AM and PM Peak Hour periods compared to the No-Build Alternative. These results are mainly due to the reduction of capacity by consolidating the ramp terminals to a single at-grade ramp terminal intersection. The intersection analysis results for Build Alternative 2 indicate that operations at the intersection SR 860/Miami Gardens Drive and SR 9/I-95 Ramps also deteriorate when compared to the No-Build Alternative. This condition is mainly due to excess weaving and queuing within the short distance between the ramp terminal and the merge point of the northbound and southbound off-ramp upstream of the intersection.

The safety analysis indicates that the majority of SR 9/I-95 within the study area is within a high crash segment. The crash data shows a concentration within the areas with higher traffic friction (i.e., merge, diverge, and weaving), including the access points to and from the Express Lanes. The safety analysis indicates that Rear End and Sideswipe crash types had the highest frequencies; these types of crashes are consistent with reoccurring congestion. To improve safety along the SR 9/I-95 study corridor, the following improvements were recommended for consideration: implement an additional express lane in each direction; implement braided ramps; implement general use and auxiliary lanes; and reduce friction areas.

The quantitative safety analysis indicates that the Build Alternatives will improve safety conditions over the No-Build Alternative. The analysis also indicates that Build Alternative 3 will produce the highest reduction in predicted crashes (i.e., highest safety improvement). Based on the safety analysis results using the FHWA Interactive Highway Safety Design Module and FHWA Interchange Configuration Safety Comparison analysis tools, the proposed Build Alternative 3 would reduce the predicted total project life cycle crashes by a total of 13,270 crashes. Of those 13,270 crashes, 10,437 are predicted to be fatal/injury crashes. These results are consistent with expectations since several of the crashes experienced along SR 9/I-95 are associated with excessive congestion and weaving activities within segments of the corridor. The proposed improvements under Build Alternative 3 will reduce congestion, weaving activities, and corresponding crash risk within the segment of SR 9/I-95 which are currently defined as high crash location segments.

Policy Point 2

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit or high occupancy vehicle and high occupancy toll lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

This SIMR project does not propose any new interchanges along SR 9/I-95. The existing interchanges provide access to public roads only. The proposed improvements at the interchanges within the study area will maintain full access to the existing crossroads of SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road and all movements are accommodated at both interchanges. The following provide descriptions of the proposed improvements under each Build Alternative.

Build Alternative 1

Alternative 1 is based on the *FDOT District 6 SR 9/I-95 Corridor Planning Study (FM: 414964-6-22-01)*, which evaluated a series of concepts and ultimately refined from 45 initial alternatives to two corridor wide concept alternatives referred as Build Concept 1 and Build Concept 2. Based on the results of the evaluation of Build Concepts 1 and 2 and input from FDOT District 6 staff, a refined or final concept referred to as Refined Build Concept was developed, which is further evaluated as Build Alternative 1 for this PD&E Study.

SR 9/I-95 Mainline and Express Lanes - Alternative 1 proposes a typical section consisting of two continuous express lanes, four general purpose lanes, and one auxiliary lane in each direction from north of the Golden Glades Interchange to the Broward County line. Within the project limits, for Alternative 1 there will continue to be two express lane ingress points. One will be located in the northbound direction between the northbound off- and on-ramps of SR 860/Miami Gardens Drive interchange and the other will be located in the southbound direction north of Snake Creek Canal. There will also continue to be two express lane egress points. One will be located in the southbound direction, south of SR 860/Miami Gardens Drive providing access to the Golden Glades Interchange; and the other in the northbound direction, north of Snake Creek Canal providing access to CR 854/Ives Dairy Road and southern Broward County.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location for both northbound and southbound on and off ramps. This single ramp terminal intersection would be located at the existing ramp terminal intersection on the east side of the SR 9/I-95 corridor with an expanded Turbo 'T' intersection. The existing signalization conditions will remain in place. The eastbound dual left turn lanes are proposed to remain at-grade similar to existing conditions.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound lane is provided to help reduce the congestion of traffic in the area.

Build Alternative 2

Alternative 2 is based on the *FDOT District 4 SR 9/I-95 (SR 9) Planning Study from south of the Golden Glades Interchange to north of the SR 9/I-95 and I-595 Interchange (FM: 436903-1-22-02) in Broward County*. From this Planning Study, an alternative was recommended to be considered in this PD&E Study, which was further evaluated as Build Alternative 2 for this PD&E Study.

SR 9/I-95 Mainline and Express Lanes - Similar to Alternative 1, Alternative 2 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. A significant difference between Alternative 1 and Alternative 2 is that a series of braided movements are proposed for the express lanes access points, and two auxiliary lanes are provided in each direction for Alternative 2, rather than one auxiliary lane in each direction. In conjunction with the braided ramps, the second auxiliary lane eliminates the need to weave across the general-purpose lanes to access the express lanes.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location (similar to Alternative 1), but with grade-separated on-ramps. This configuration allows for traffic to free flow onto the mainline, as opposed to Alternative 1, which provides at-grade traffic signal control.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the existing diamond interchange to a Single Point Urban Interchange (SPUI). Similar to Alternative 1, an additional eastbound lane is provided along the arterial.

Build Alternative 3

SR 9/I-95 Mainline and Express Lanes - Alternative 3 was developed based on feedback from the Public Alternatives Workshop. Alternative 3 is based on a combination of Alternative 1 and Alternative 2, with refinements. Alternative 3 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. Same as in Alternative 2, the braided ramps and additional auxiliary lanes eliminate the need to weave across the general-purpose lanes to access the express lanes.

SR 860/Miami Gardens Drive - Same as in Alternative 2, the proposed improvements at SR 860/Miami Gardens Drive consist of a grade-separated on-ramp. This configuration will allow for traffic to free flow onto the mainline. In addition, the northbound and southbound off ramp will be extended and connected to the west of SR 9/I-95 in advance of the modified single ramp terminal to the east of SR 9/I-95. The purpose for this configuration is to accommodate the weaving friction between these two movements along a longer segment and to increase storage length to avoid spill back into SR 9/I-95 mainline.

CR 854/Ives Dairy Road - Same as in Alternative 1, improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound through lane, an additional westbound to northbound on-ramp lane, and new signal timing are provided to help reduce the congestion of traffic in the area.

1 PROJECT OVERVIEW

1.1 Introduction

This Systems Interchange Modification Report (SIMR) is being prepared as part of the Project Development & Environment (PD&E) to address the proposed improvements at the SR 9/I-95 corridor from south of SR 860/Miami Gardens Drive to north of Broward County Line.

Within the project limits, SR 9/I-95 is classified as 'Urban Principal Arterial Interstate' and consists of six to eight general use lanes and two to four express lanes; the typical section varies throughout the project segment. This section of the corridor is located north of the Golden Glades Interchange in northern Miami-Dade County and traverses five U.S. Census Designated Places, including North Miami Beach, Ojus, Ives Estates, Pembroke Park, and Hallandale Beach. It connects to SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, two important east-west facilities within northern Miami-Dade County. Existing right-of-way along the project segment ranges from approximately 300 feet to over 1,000 feet in width.

It should be noted that the greater SR 9/I-95 corridor is part of Florida's Strategic Intermodal System (SIS) highway network and is a designated state hurricane evacuation route. In addition, SR 9/I-95 serves a critical role in facilitating the north-south movement of traffic in southeast Florida as one of two major expressways (Florida's Turnpike being the other) that connect the major employment centers and residential areas between Miami-Dade, Broward, and Palm Beach Counties. The corridor traverses dense urban areas with predominantly commercial and residential uses, including downtown Miami.

Previous studies have identified the need for capacity improvements, which in turn will also improve safety within this segment of SR 9/I-95. The regional roadway system is also close to build-out and the ability to add more traffic lanes is limited. The proposed improvements analyzed in the SIMR stem from the Build Concepts that were developed as part of the *2019 FDOT District 6 SR 9/I-95 Corridor Planning Study* and *2020 FDOT District 4 Interstate 95 Corridor Planning Study*, that assessed enhancements along the length of the SR 9/I-95 corridor within Miami-Dade. As such, this project is part of a larger effort to improve the SR 9/I-95 corridor within Miami-Dade County and regionally within Broward and Palm Beach Counties.

The studies' preferred alternatives were recommended for further consideration in the Project Development phase to provide additional capacity while minimizing modifications to programmed/planned improvements pertaining to other projects along the SR 9/I-95 corridor, as well as to reduce right-of-way acquisition/impacts and construction costs. General design parameters for the corridor include minimum 11-foot wide travel lanes, 10-foot wide express lane inside shoulders, and 4-foot wide buffers with tubular markers between the express lanes and general use lanes; 12-foot lanes are generally provided in segments that include more extensive reconstruction/widening, and 11-foot lanes are utilized in areas where modifications are less extensive or needed to match the existing/programmed/planned geometry.

1.2 Purpose and Need for Project

The purpose of this project is to address the deficient operational capacity and relieve existing/future congestion along the SR 9/I-95 corridor and its interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, which in turn will improve safety and reduce travel time. Other goals of the project are 1) to preserve the operational integrity and regional functionality of SR 9/I-95 (and, therefore, the regional transportation network) by providing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties and 2) to enhance emergency evacuation and response times.

1.3 Project Location

This project entails potentially providing additional express and/or general use lanes on SR 9/I-95, from south of SR 860/Miami Gardens Drive Interchange (MP 13.724) to Broward County Line (MP 17.199), in Miami-Dade County, Florida. This project also assesses improvements at the SR 9/I-95 interchanges with SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road. Per Florida Administrative Code (FAC) 14-97.0003, Access Control Classification System and Access Management Standards, the applicable interchange spacing standard is one (1) mile for this segment of SR 9/I-95 classified as Access Class 1, Area Type 1 – CBD & CBD Fringe for Cities in Urbanized. **Figure 1.1** provides a Project Location and **Table 1.1** summarizes the interchange spacing within the project limits.

Table 1.1 – Existing Year 2021: SR 9/I-95 Interchange Spacing

Interchange Crossroad	Approximate Crossroad Centerline Milepost[1]	Approximate Interchange Spacing (Miles)
SR 858/Hallandale Beach Boulevard	0.769[2]	1.447
CR 854/Ives Dairy Road	16.521	1.958
SR 860/Miami Gardens Drive	14.563[3]	1.431
Golden Glades Interchange	13.132[4]	

(1) Based on 87-270-000 Straight-Line Diagram (SLD)
(2) Based on 86-070-000 Straight-Line Diagram
(3) Measured between NB ramps
(4) Measured at SR-7/US-441

1.4 Planned and Programmed Transportation Projects

The improvements will be developed consistent with applicable plans or steps will be taken to achieve consistency. While the SR 9/I-95 project segment from south of SR 860/Miami Gardens Drive to the Broward County Line is identified in various planning documents, it is specifically cited as part of a longer section extending from south of SR 836/I-395 to the Broward County Line. The project is identified as funded in the Miami-Dade Transportation Planning Organization's (TPO) 2050 Long Range Transportation Plan (LRTP). The project is also included within the FDOT Fiscal Year (FY) 2024/2025 – FY 2028/2029 Strategic Intermodal System (SIS) First Five-Year Plan, FDOT FY 2025 – FY 2029 Work Program, FDOT FY 2024/2025 – FY 2028/2029 State Transportation Improvement Program (STIP), and the Miami-Dade TPO's FY 2025-2029 Transportation Improvement Program (TIP) with funding allocated for the Project Development and Environment (PD&E) and Preliminary Engineering phases. It is additionally identified in the FDOT FY 2030 – FY 2050 SIS Long Range Cost Feasible Plan with funding allocated for the Right of Way (ROW) / Construction phase. Relevant information related was extracted from the above referenced documents and presented in **Appendix B** for ease of reference. It should be noted that the most recent documents were reviewed instead of editions listed in the MLOU.

1.5 Requestor Information

This SR 9/I-95 SIMR has been prepared for the Florida Department of Transportation, District Six. For additional information on the SIMR, please contact the Department's Project Manager at:

Auraliz Benitez, PE, Project Manager
FDOT- District 6
1000 NW 111 Avenue, Room 6251
Miami, FL 33172
Phone: (407) 407-5471
E-mail: Auraliz.Benitez@dot.state.fl.us

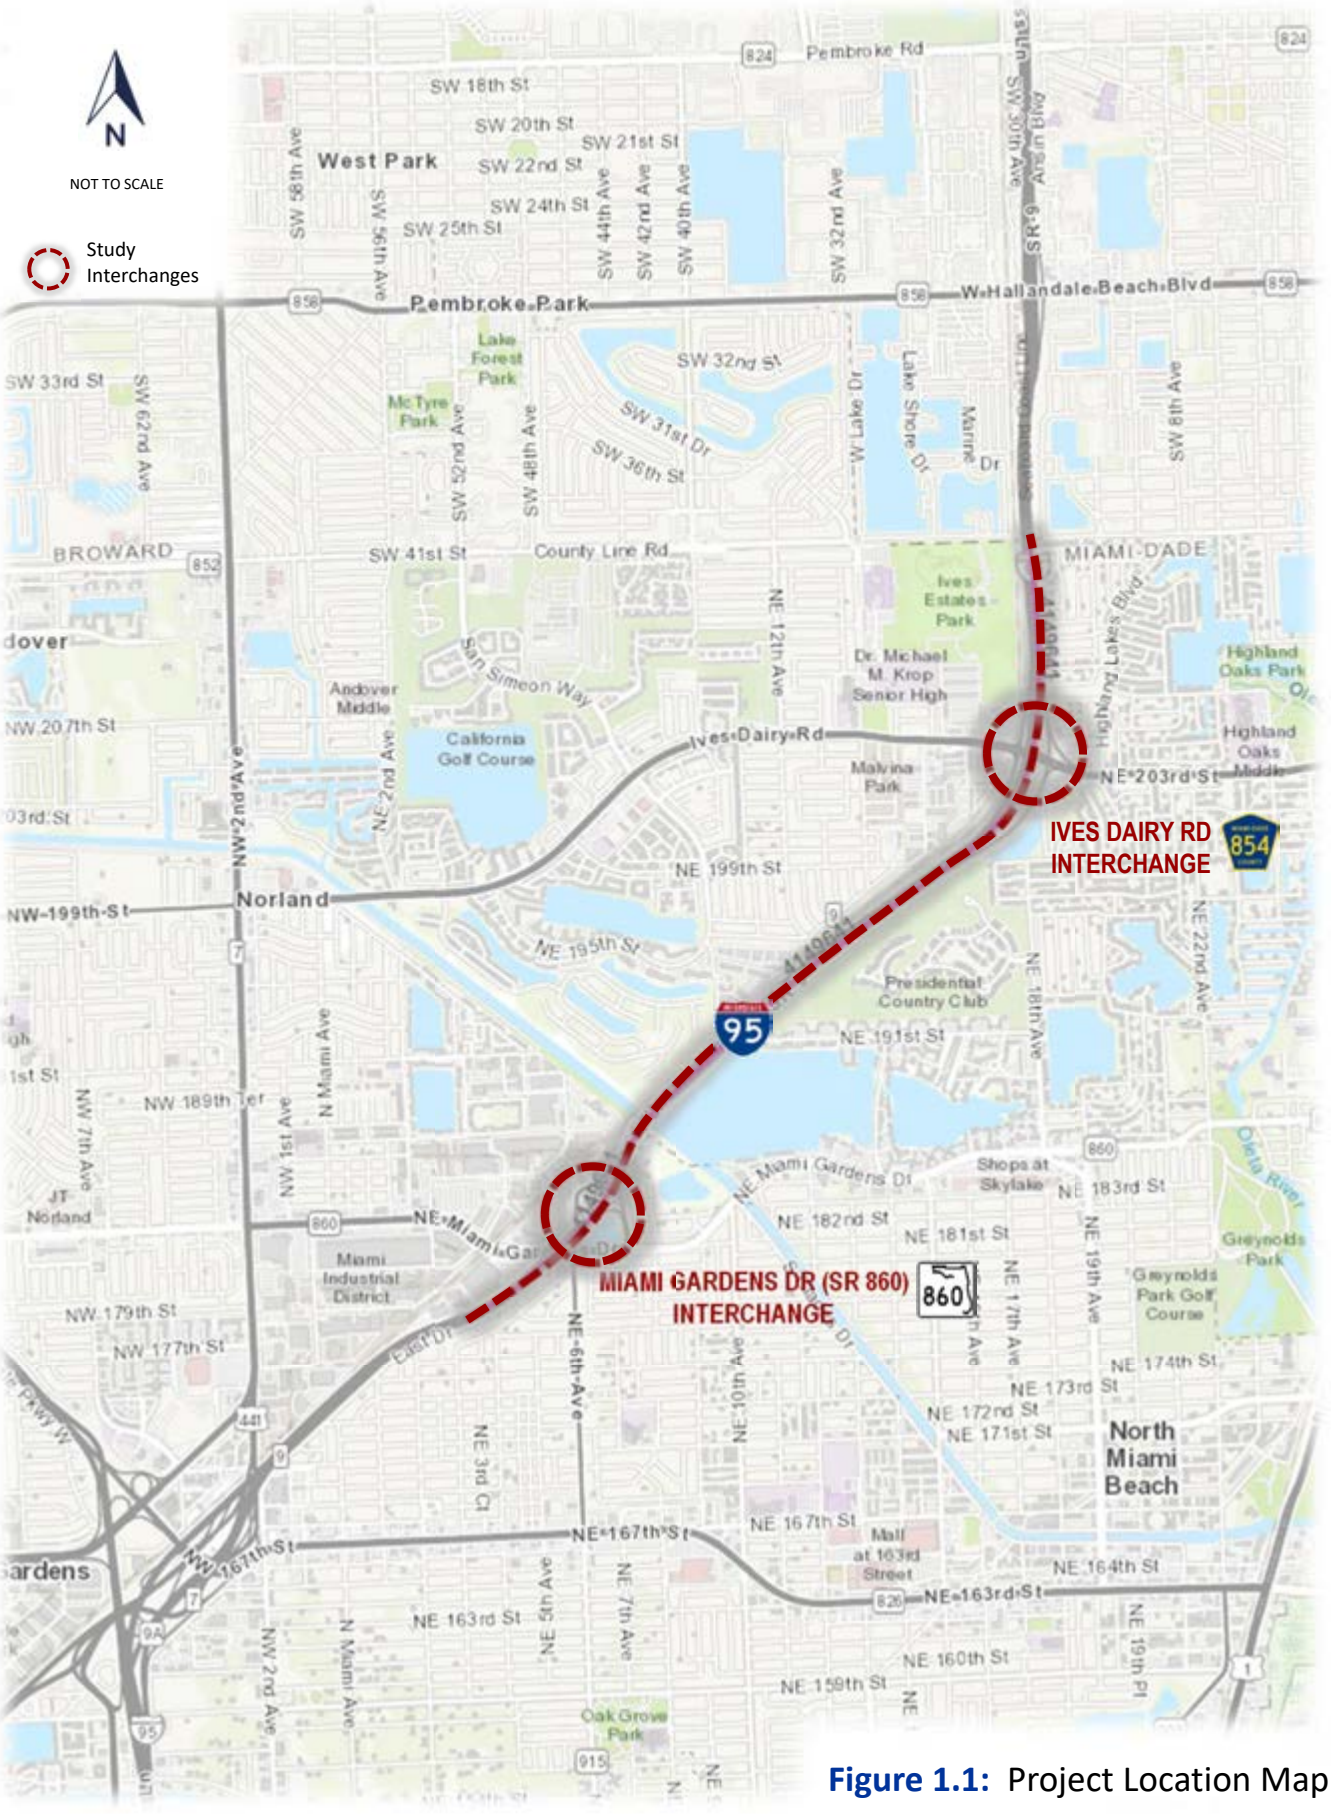

Figure 1.1: Project Location Map

2 METHODOLOGY

The methodology applied for this SR 9/I-95 SIMR is documented in the Methodology Letter of Understanding (MLOU), dated November 2, 2021. The MLOU was approved by FDOT District 6 and FDOT Central Office Systems Implementation Office. The MLOU outlines the criteria, assumptions, processes, analyses and documentation requirements for the project. The approved MLOU is included in **Appendix A** for ease of reference. The following summarizes some of the more prominent issues covered under the MLOU and needed deviations to better serve the project as presented on each section.

2.1 Area of Influence

In urban areas, the area of influence (AOI) as defined in the *2020 Interchange Access Request Users Guide*, includes the on- and off-ramp gore points of the adjacent interchange in each direction and signalized intersections within half-a-mile of the interchanges. However, these limits have been modified, as follows and are shown in **Figure 2.1**:

2.1.1 SR 9/I-95 Mainline

SR 9/I-95 from the on- and off-ramp gore points from/to SR 7/US-441 (on the southern limit) to the off- and on-ramp gore point to/from SR 858/Hallandale Beach Boulevard (on the northern limit).

2.1.2 Crossroads:

The AOI along SR 860/Miami Gardens Drive extends from NE 2nd Avenue to NE 10th Avenue, including the following signalized intersections:

- SR 860/Miami Gardens Drive at NE 2nd Avenue;
- SR 860/Miami Gardens Drive at NE 2nd Court;
- SR 9/I-95 SB Ramp Terminal/NE 6th Avenue (SR 915) at SR 860/Miami Gardens Drive;
- SR 9/I-95 NB Ramp Terminal at SR 860/Miami Gardens Drive; and
- SR 860/Miami Gardens Drive at NE 10th Avenue.

The AOI along CR 854/Ives Dairy Road extends from NE 15th Court to Highland Lakes Boulevard, including the following intersections:

- CR 854/Ives Dairy Road at NE 15th Court;
- CR 854/Ives Dairy Road at NE 16th Avenue;
- SR 9/I-95 SB Ramp Terminal at CR 854/Ives Dairy Road;
- SR 9/I-95 NB Ramp Terminal at CR 854/Ives Dairy Road; and
- CR 854/Ives Dairy Road at Highland Lakes Boulevard.

2.2 Analysis Years

The analysis years for the project were determined as follows:

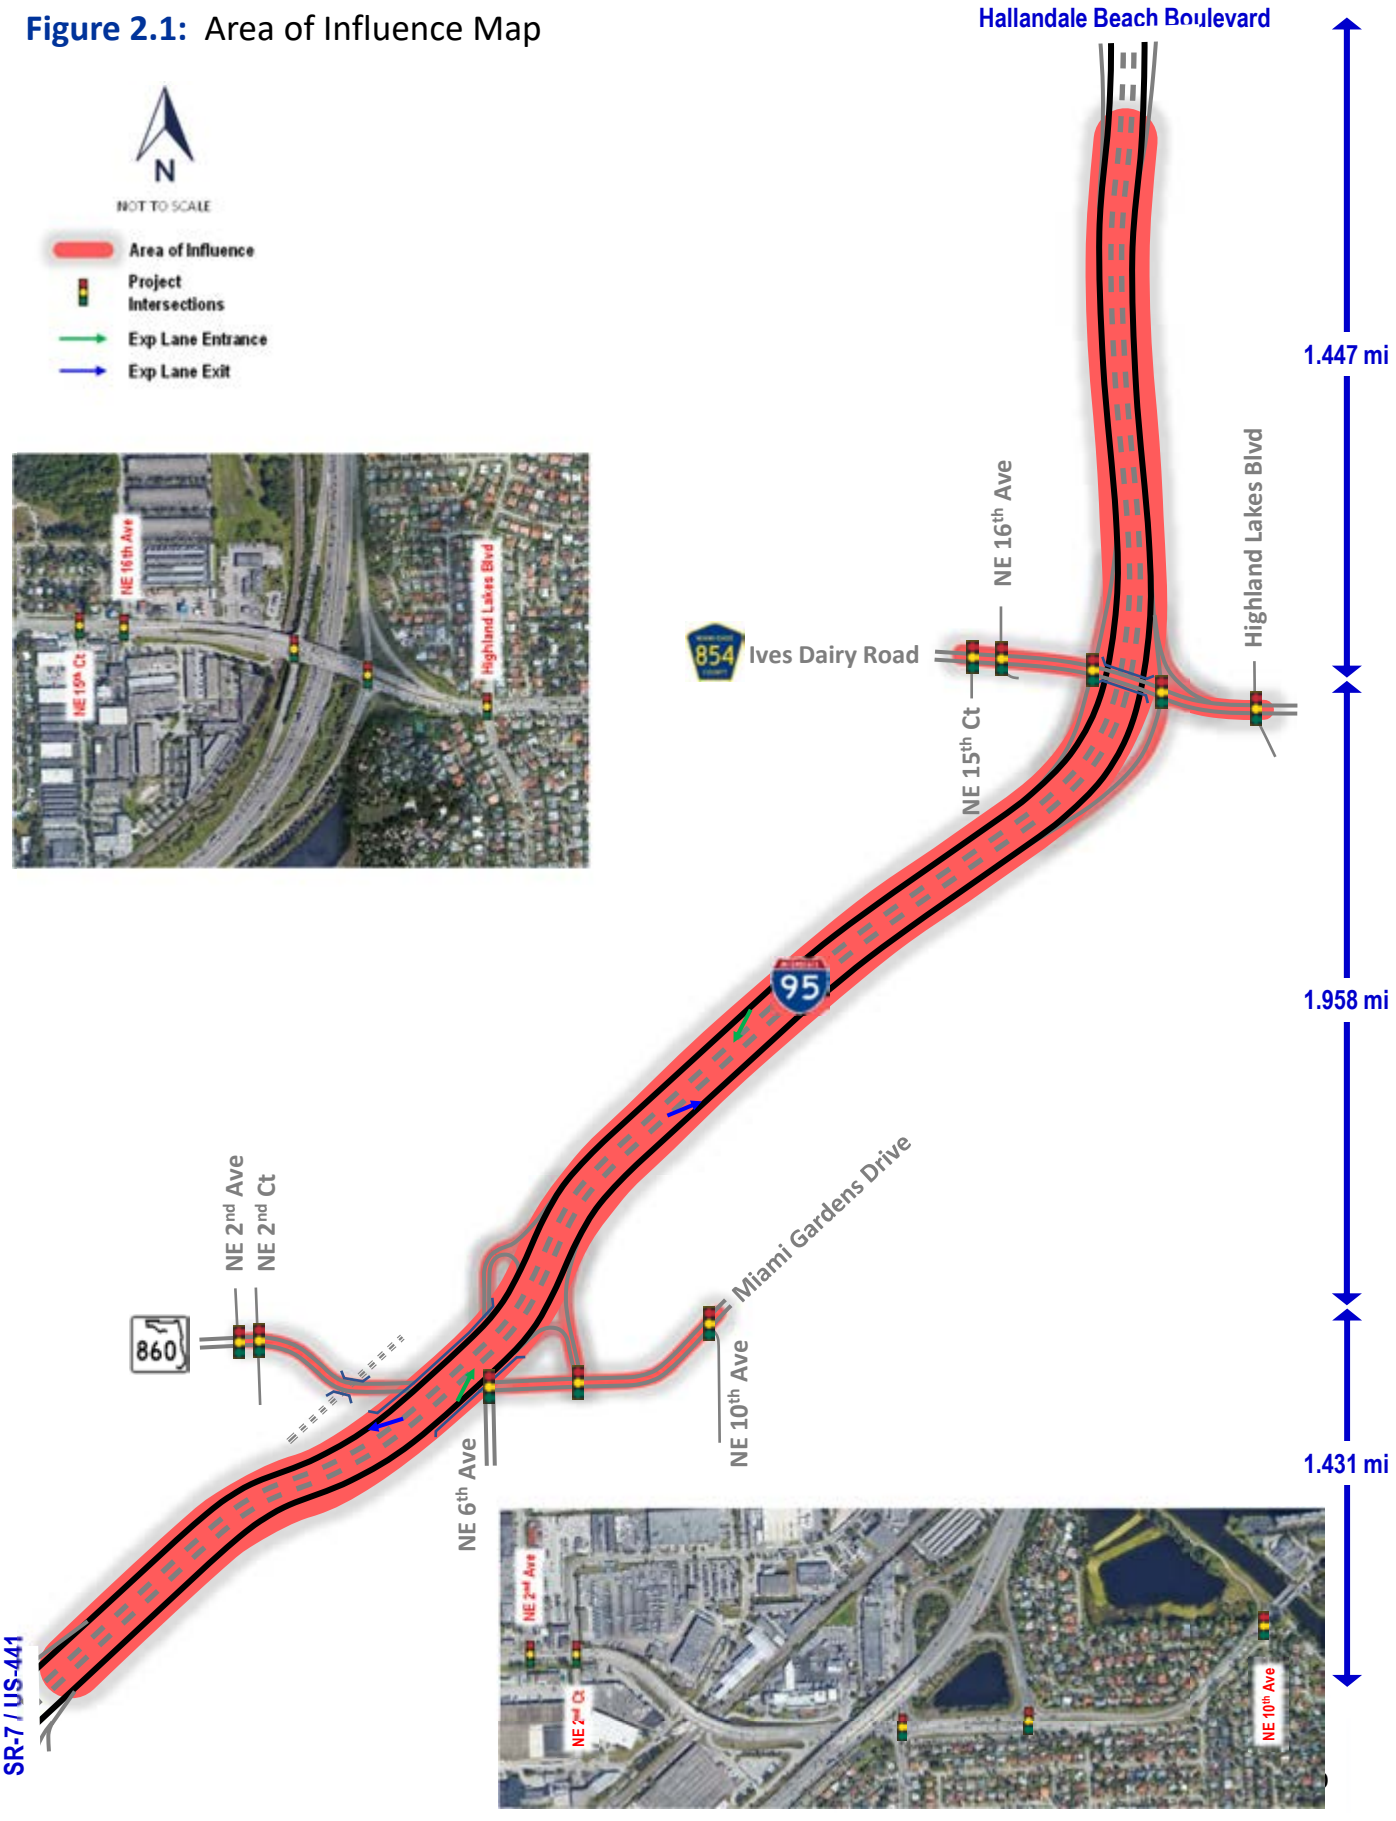
2.2.1 Traffic Forecasting

- Base year 2015
- Horizon year 2045

2.2.2 Traffic Operational Analysis

- Existing year 2021
- Opening year 2030
- Design year 2050

Figure 2.1: Area of Influence Map



2.3 Travel Demand Forecasting

As part of this study, traffic projections were prepared for future Opening Year 2030 and Design Year 2050 under the No-Build and Build Alternative conditions. Based on coordination with the Department, the No-Build conditions are defined as transportation network with the inclusion of Cost Feasible Plan improvements in the adopted TPO 2045 Long Range Transportation Plan (LRTP), which includes improvements to the Golden Glades Interchange (GGI) to the south of the study area for Design Year 2050. The GGI improvements are not included for the No-Build conditions of the Opening Year 2030. In addition, the preferred alternative from the SR 9/I-95 PD&E study from Hallandale Beach Boulevard to Hollywood Boulevard is also included as part of the No-Build conditions.

2.3.1 Selected Travel Demand Model

The modeling efforts were coordinated with the adjacent projects in FDOT District 4 and are shown in the *Traffic Data & Projections Memorandum for SR9/I-95 from South of Miami Gardens Drive to North of Miami-Dade/Broward County Line, dated February 2024* (District 6 segment) and *Traffic Data Collection & Traffic Projections for SR 9/I-95 PD&E Study from Miami-Dade/Broward County Line to North of Griffin Road Report, dated May 20, 2020* (District 4 segment). The Southeast Florida Regional Planning Model (SERPM), Version 8.513 has been used for travel forecasting for this project. The SERPM 8.513 is an Activity-Based Model (ABM) that simulates both household-level and person-level travel choices including intra-household interactions with household members. SERPM 8.513 model is validated to Year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible plans from Miami-Dade TPO, Broward MPO, and Palm Beach Transportation Planning Agency (TPA). It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies.

A future year (2045) no-build network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three planning institutions in the region. The socioeconomic data, network coding, and other model settings were reviewed to make them consistent with subsequent changes. The 2045 No-Build network was developed in close coordination with FDOT District 4 and District 6 Project Managers and District 4's SR 9/I-95 PD&E from SR 858/Hallandale Beach Boulevard to Hollywood Boulevard Team. The 2045 No-Build network was built by incorporating the Locally Preferred Alternative (LPA) from the SR 9/I-95 Corridor Planning Study and Golden Glade Interchange (GGI) Ultimate Design as provided by FDOT.

The Base Year 2015 SERPM has HOV lanes and not Express Managed Lanes. Express Lanes were not fully implemented until 2016 based on Google Earth Pro Historical Imagery. Therefore, the accuracy of the Express Lanes usage prediction cannot be properly assessed. In addition, the subarea validation indicates that the accuracy of the SERPM model predictions deteriorates for arterials, which will also impact the accuracy of origin-destination matrices from the models.

An Origin-Destination/Traffic Assignment analysis was conducted to provide an understanding of the travel patterns along the corridor and provide information for traffic analysis when considering one-sided, two-sided and overlapping weaving. The project to the north used StreetLight data to develop an origin-destination matrix table. However, this information covered only up to Ives Dary Road, it did not include express lane locations as destination-origins, and it was only for daily data.

Therefore, Build Alternatives 1, 2, and 3 were developed by reassigning the 2050 No-Build volumes to each of the Build Alternatives based on the origin-destination and modified roadway network information to better assess the capacity improvements from the proposed roadway modifications. In addition, the volume assignment to/from a ramp from/to another ramp was developed from the total volume assigned at each ramp (including express lane ingress and egress ramps) between the Golden Glades Interchange and I-595.

2.3.2 Projected Traffic Forecast Development Methodology

Traffic projections for Design Year 2050 were developed for both the AM and PM peak periods. The Southeast Florida Regional Planning Model (SERPM), Version 8.513 has been used for this project. Horizon year 2045 No-Build scenario was modeled. Build Alternatives 1, 2, and 3 were developed by reassigning the 2050 No-Build volumes to each of the Build Alternatives based on the origin-destination and modified roadway network information. For Design Year 2050, traffic volumes were extrapolated from future year 2045. For opening year 2030, traffic volumes were interpolated between Existing Year 2021 and Design Year 2050.

The model results were post-processed. Existing Year 2021 model AADTs were developed by interpolating SERPM 2015 and 2045 model volumes and compared to actual existing year 2021 traffic counts. Future year link volumes were adjusted using two factors: the ratio of the actual existing year 2021 traffic counts to the interpolated year 2021 model volumes and the numerical difference between the actual existing year 2021 traffic counts and the interpolated year 2021 model volumes. Where appropriate, forecasted model volumes were used. The resulting growth rates of the SERPM forecasted volumes were compared against growth trends of historical counts and model socio-economic/land use data. Any outlier links were postprocessed. The ratio and difference adjustments were checked against a minimum growth rate of 0.5% per year for reasonableness. DDHVs were developed using the FDOT D4 TMTool based on methodologies presented in the *2021 FDOT Project Traffic Forecasting Handbook*. The volumes were balanced and smoothed as needed. Coordination was carried out to ensure the AADT projections at the county line along SR 9/I-95 are consistent with the AADT forecasted by the SR 9/I-95 PD&E Team north of the county line.

2.4 Traffic Factors

The diurnal factors are the peak period to peak-hour conversion factors and were determined based on the traffic data collected. The diurnal factors were compared against the values used in the previous planning study. The corridor traffic count profile by hour were examined within the peak periods as well as the diurnal factors for the various SR 9/I-95 mainline stations by direction. An average of the factors was considered in the development of the design traffic. The variation in diurnal factors within the study area is not significant from one station to the other.

The T24 factor is the 24-hour percentage of truck traffic. The Design Hour Truck (DHT) factor is the percentage of truck traffic during the peak-hour and is assumed to remain constant through the design year. Design Hour Truck (DHT) values were calculated based on historical data from the FDOT count sites within the study area, mechanical classification counts and turning movement counts conducted by the Department as part of the data collection efforts. DHT values from mechanical counts were calculated as half the daily value in accordance with the FDOT Project Traffic Forecasting Handbook.

The following DHT values were used based on existing and historical data. The closest FDOT permanent telemetered traffic monitoring station along SR 9/I-95, 86-0331, has an average T24 of 5.25; therefore, a calculated DHT value of 3% was selected for SR 9/I-95. For SR 860/Miami Gardens Drive a calculated DHT value of 2% was selected since the T24 shows an average of 4% from the historical data, and the existing TMCs show an average of 3%. For CR 854/Ives Dairy Road a calculated DHT value of 2% was selected since the T24 shows an average of 6% from the historical data, and the existing TMCs show an average of 1%.

2.5 Traffic Operational Analysis

As indicated in the Traffic Analysis Software Used table of the MLOU, there is an overlap on the use of HCS and Vissim software for the analysis of Freeways. Both software will be used for analyzing existing and future No-Build and Build scenarios. However, HCS will be used through the development of enhanced alternatives; and Vissim will be used for final comparison of each scenario and alternatives. It should also be noted that both software will be used for Complex Weave Analysis; Method 1: Individual Elements Analysis (HCM Based); and Method 2: V/C Ratio Using Vissim in compliance with *2021 FDOT Traffic Analysis Handbook*. As stated in the Handbook, MOEs from HCS are not required to be reported when microsimulation analysis is performed.

The operational analysis of the freeway, express lanes, ramp terminal intersections, and the adjacent intersection of CR 854/Ives Dairy Road at Highland Lakes Boulevard was performed in accordance with FDOT's Traffic Analysis Handbook using Vissim microsimulation software. A four-hour analysis period was selected to ensure that traffic operations were accurately modeled. The four-hour analysis period provided adequate time for congestion build-up and dissipation. A 30-minute seeding period was coded. The second hour represented the peak hour. Traffic volumes were entered in 15-minute increments as exact values. The Vissim model was created in compliance with guidance to Vissim Model Development. The number of required runs, calibration targets and calibration parameters were determined using the formulas and tables included in the *2021 FDOT Traffic Analysis Handbook*.

The Vissim microsimulation was error checked and calibrated to volume and speed data obtained from RITIS and FDOT databases. Speed and volume calibration parameters indicate adequate calibration The Vissim Model Verification (Error Checking) Process Checklist was filled out as part of the calibration process. Logical data collection points in the Vissim simulation network were selected to match the RITIS and FDOT data collection locations to obtain comparable results. Speed and processed volumes from the simulation outputs were compared against data from the FDOT RITIS system or other available data sources to ensure that the simulation provides similar trends and areas of congestion.

SR 9/I-95 Off-Ramp queues at ramp terminal intersections were calibrated based on qualitative observations instead of quantitative (to be within 20% difference between simulated and observed queue lengths) as stated in the MLOU. This deviation was necessary since the SR 9/I-95 Off-Ramp queues extend more than 25 vehicles and pass the exclusive turn lane storage. When the queues from one exclusive turning lane(s) extended beyond their storage lengths, this turning traffic gets mixed up with the other turning movement. Under these conditions, Vissim reports the same queue length for all the movements in the same approach. Therefore, the comparison of Vissim model queues to a physical location on the field was considered more appropriate. It should be noted that physical reference for the extent of queue from field observations and Vissim calibration results relate to maximum queues (i.e., not average).

The Vissim Complex Weaving Analysis results are presented in this report. The analysis based on Section 8.8 of the *2021 FDOT Traffic Analysis Handbook*. The analysis considers V/C Ratio, Speed Differential and Vehicles Disappearing. The reduction in the capacity to 1,800 vehicles per hour was used to determine the volume to capacity (V/C) ratio using Equation 2-1 for each complex weave segment within the project.

Equation 2-1

$$V/C = \frac{peak\ hour\ freeway\ demand\ volume\ in\ critical\ weaving\ segment}{per\ lane\ capacity \times number\ of\ lanes}$$

For the Speed Differential analysis, the speeds for weaving and nonweaving vehicles from all origins and destinations within the complex weave segment were extracted from the microsimulation model to assess the impacts of multiple crossing movements. It is recommended that the speed difference between weaving and nonweaving movements be within 10 mph. A higher speed differential indicates slowdown, meaning the length of the complex weave segment is not adequate and there is congestion within the complex weave segment.

For the Vehicle Disappearing analysis, the number of vehicles disappearing within each complex weave segment is reported and compared between no-build and build alternatives. The build alternative should not have more vehicles disappearing than the no-build within the complex weave segment. In addition, the build alternative disappearing vehicles should be less than ten (10) vph within the complex weave segment. This is measured between upstream of the first entry to downstream of the last exit forming the complex weave segment.

The traffic operational analysis for the other five adjacent intersections was performed using Synchro. The calibration process for Synchro intersection analysis consisted of comparing the queuing results and visual field audits. Reasonableness checks were performed by comparing the synchro calculated queues and the queues observed along the arterial intersections. Special consideration was given to 95th percentile queue lengths that are tagged with "#" or "m". These queue results will be examined for the extent of queuing problems. The "#" indicates that the volume for the 95th percentile cycle exceeds capacity. The "m" indicates that volume for the 95th percentile queue is metered by an upstream signal.

The Vissim microsimulation and Synchro operational analyses were performed for the following conditions:

- Existing Year 2021 conditions, AM and PM periods.
- Opening Year 2030 conditions for No-Build and three Build Alternatives, AM and PM periods.
- Design Year 2050 No-Build and three Build Alternatives, AM and PM periods.

2.5.1 Measures of Effectiveness (MOE)

FDOT Topic No. 000-525-006-c provides LOS Targets for the State Highway System (SHS). The automobile mode LOS D target is considered applicable for this SIMR within an urbanized area. It should be noted that LOS is established based on HCM criteria. However, the LOS results from the Vissim microsimulation is reported in accordance with Section 9.5.1 of the *2021 FDOT Traffic Analysis Handbook*. This chapter outlines the approach to estimate density and LOS as well as color code speed thresholds using density and speed results obtained from microsimulation analysis.

Link based density obtained from microsimulation model is in vehicles per mile. Microsimulation model density can be converted to passenger cars per mile per lane (pcpmpl) using the Equations 2-2 and 2-3 below which can then be used to estimate LOS using HCM thresholds.

Equation 2-2

$$Estimated\ Density\ (pcpmpl) = \frac{Density\ (vpm)}{Number\ of\ lanes} * f(hv)$$

Where,
$Density_{(vpm)}$ = Link Density from microsimulation
$f_{(hv)}$ = Adjustment factor for presence of heavy vehicles in traffic stream using HCM 6th Edition

Equation 2-3

$$f_{(hv)} = \frac{1}{1 + P_T\,(E_T - 1)}$$

Where,
$f_{(hv)}$ = Heavy – vehicle adjustment factor (decimal)
PT = Proportion of Single Unit Trucks (SUTs)and Tractor Trailers (TTs) in traffic stream (decimal)
ET = Passenger car equivalent of one (1) heavy vehicle in traffic stream (PCEs)

Table 2.1 shows congestion level thresholds based on speed for a roadway with a posted speed limit of 55 mph, which applies to this segment of SR 9/I-95.

Table 2.1 – Congestion Level Thresholds

Congestion Level	Freeways				
	Posted Speed (mph)				
	50	55	60	65	70
Uncongested	>=50	>=53	>=59	>=61	>=63
Lightly Congested	< 50 - 47	< 53 - 48	< 59 - 54	< 61 - 56	< 63 - 57
Moderately Congested	< 47 - 42	< 48 - 43	< 54 - 44	< 56 - 45	< 57 - 45
Heavily Congested	< 42	< 43	< 44	< 45	< 45

A posted speed limit of 55 mph applies for this segment of SR 9/I-95

Vissim microsimulation measures of effectiveness (MOEs) include Estimated LOS, Density (veh/mi/ln), Speed (mph), Simulated Volume compared to Demand Volume, Total Delay (hours), Average Delay (seconds per vehicle), Total Travel Time (hours), Latent Demand (veh), Average Speed (mph), and maximum queue for SR 9/I-95 Off-Ramps. Synchro MOEs include LOS, Delay (veh/sec), Volume-to-Capacity (v/c) ratio, and 95th Percentile Queue. The storage available for the turn movements, measured from the stop bar to the taper, are clearly reported in figures and tables for comparison with the queue length. At the off-ramp terminal intersections, the queue length is reported in figures and tables along with the storage length for the left and right turning lanes. In addition to the turn lane storage, the total ramp length, measured from the stop bar to the gore point with the freeway is provided.

2.6 Safety Analysis

Detailed crash data within the study area will be analyzed and documented. The latest five year of crash data shall be used. At the time of MLOU signage, the latest five years were defined as years 2016 to 2020. The historical safety analysis has been updated to the latest five years from 2019 to 2023. Similarly, the main FDOT safety data source were State Safety Office GIS (SSOGIS) / CAR Online (The Florida Department of Highway Safety and Motor Vehicles (FLHSMV) data post-processed by FDOT to support safety analyses) at the time of the MLOU signing. On April of 2023, the FDOT State Safety Office announced that Signal 4 Analytics (S4) is now the official crash data repository and the sole source of crash information for FDOT Safety Analyses, which also provides “high crash locations”. Therefore, the crash analysis has been updated accordingly. In addition, the AOI for the safety analysis for future conditions was reduced to exclude adjacent intersections since no improvements are proposed for these intersections. Therefore, future year safety analysis includes SR 9/I-95 mainline, Express Lanes, Ramps and Ramp Terminal Intersections.

3 EXISTING YEAR 2021 CONDITIONS

3.1 Existing Land Use

The west side of the SR 9/I-95 at SR 860/Miami Gardens Drive Interchange is located within unincorporated Miami-Dade County; the east side of the interchange is located within the City of North Miami Beach. The SR 9/I-95 at CR 854/Ives Dairy Road Interchange is located within unincorporated Miami-Dade County. **Appendix C** presents the Miami-Dade County Existing Land Use Map and the City of North Miami Beach Zoning Map, for ease of reference. The maps show the following zone classifications for each of the interchanges:

3.1.1 SR 860/Miami Gardens Drive

- Residential at the NE and SE quadrants of the interchange; and
- Industrial at the NW and SW quadrants of the interchange.

3.1.2 CR 854/Ives Dary Road

- Residential at the NE and SE quadrants of the interchange; and
- Industrial and Communications/Utilities/Terminals at the NW and SW quadrants of the interchange.

3.2 Existing Road Characteristics

The general characteristics of the roadway facilities located within the project limits are described in the sections below. The data below is based on information gathered from the FDOT's Roadway Characteristics Inventory (RCI), Straight Line Diagrams (SLDs), Miami-Dade County TPO, Miami-Dade County Traffic Signals and Signs Division (TS&S) and field reviews. Aerial views of the interchanges are presented in **Figures 3.1** and **3.2**. The existing roadway and intersection lane configurations are depicted in **Figure 3.3**.

3.2.1 SR 9/I-95 from south of SR 860/Miami Gardens Drive to north of CR 854/Ives Dairy Road

Facility Type: Freeway, Limited Access, SIS Facility
Context Classification: Context classification does not apply to limited access facilities.
Functional Classification: Urban Principal Arterial - Interstate
Access Management Classification (FDOT): Class 1
Posted Speed Limit: 55 mph
Typical Section:
North of CR 854/Ives Dairy Road Interchange:

- SB: 1 AUX, 4 GP, 1 EXP / NB: 1 EXP, 4 GP, 1 AUX

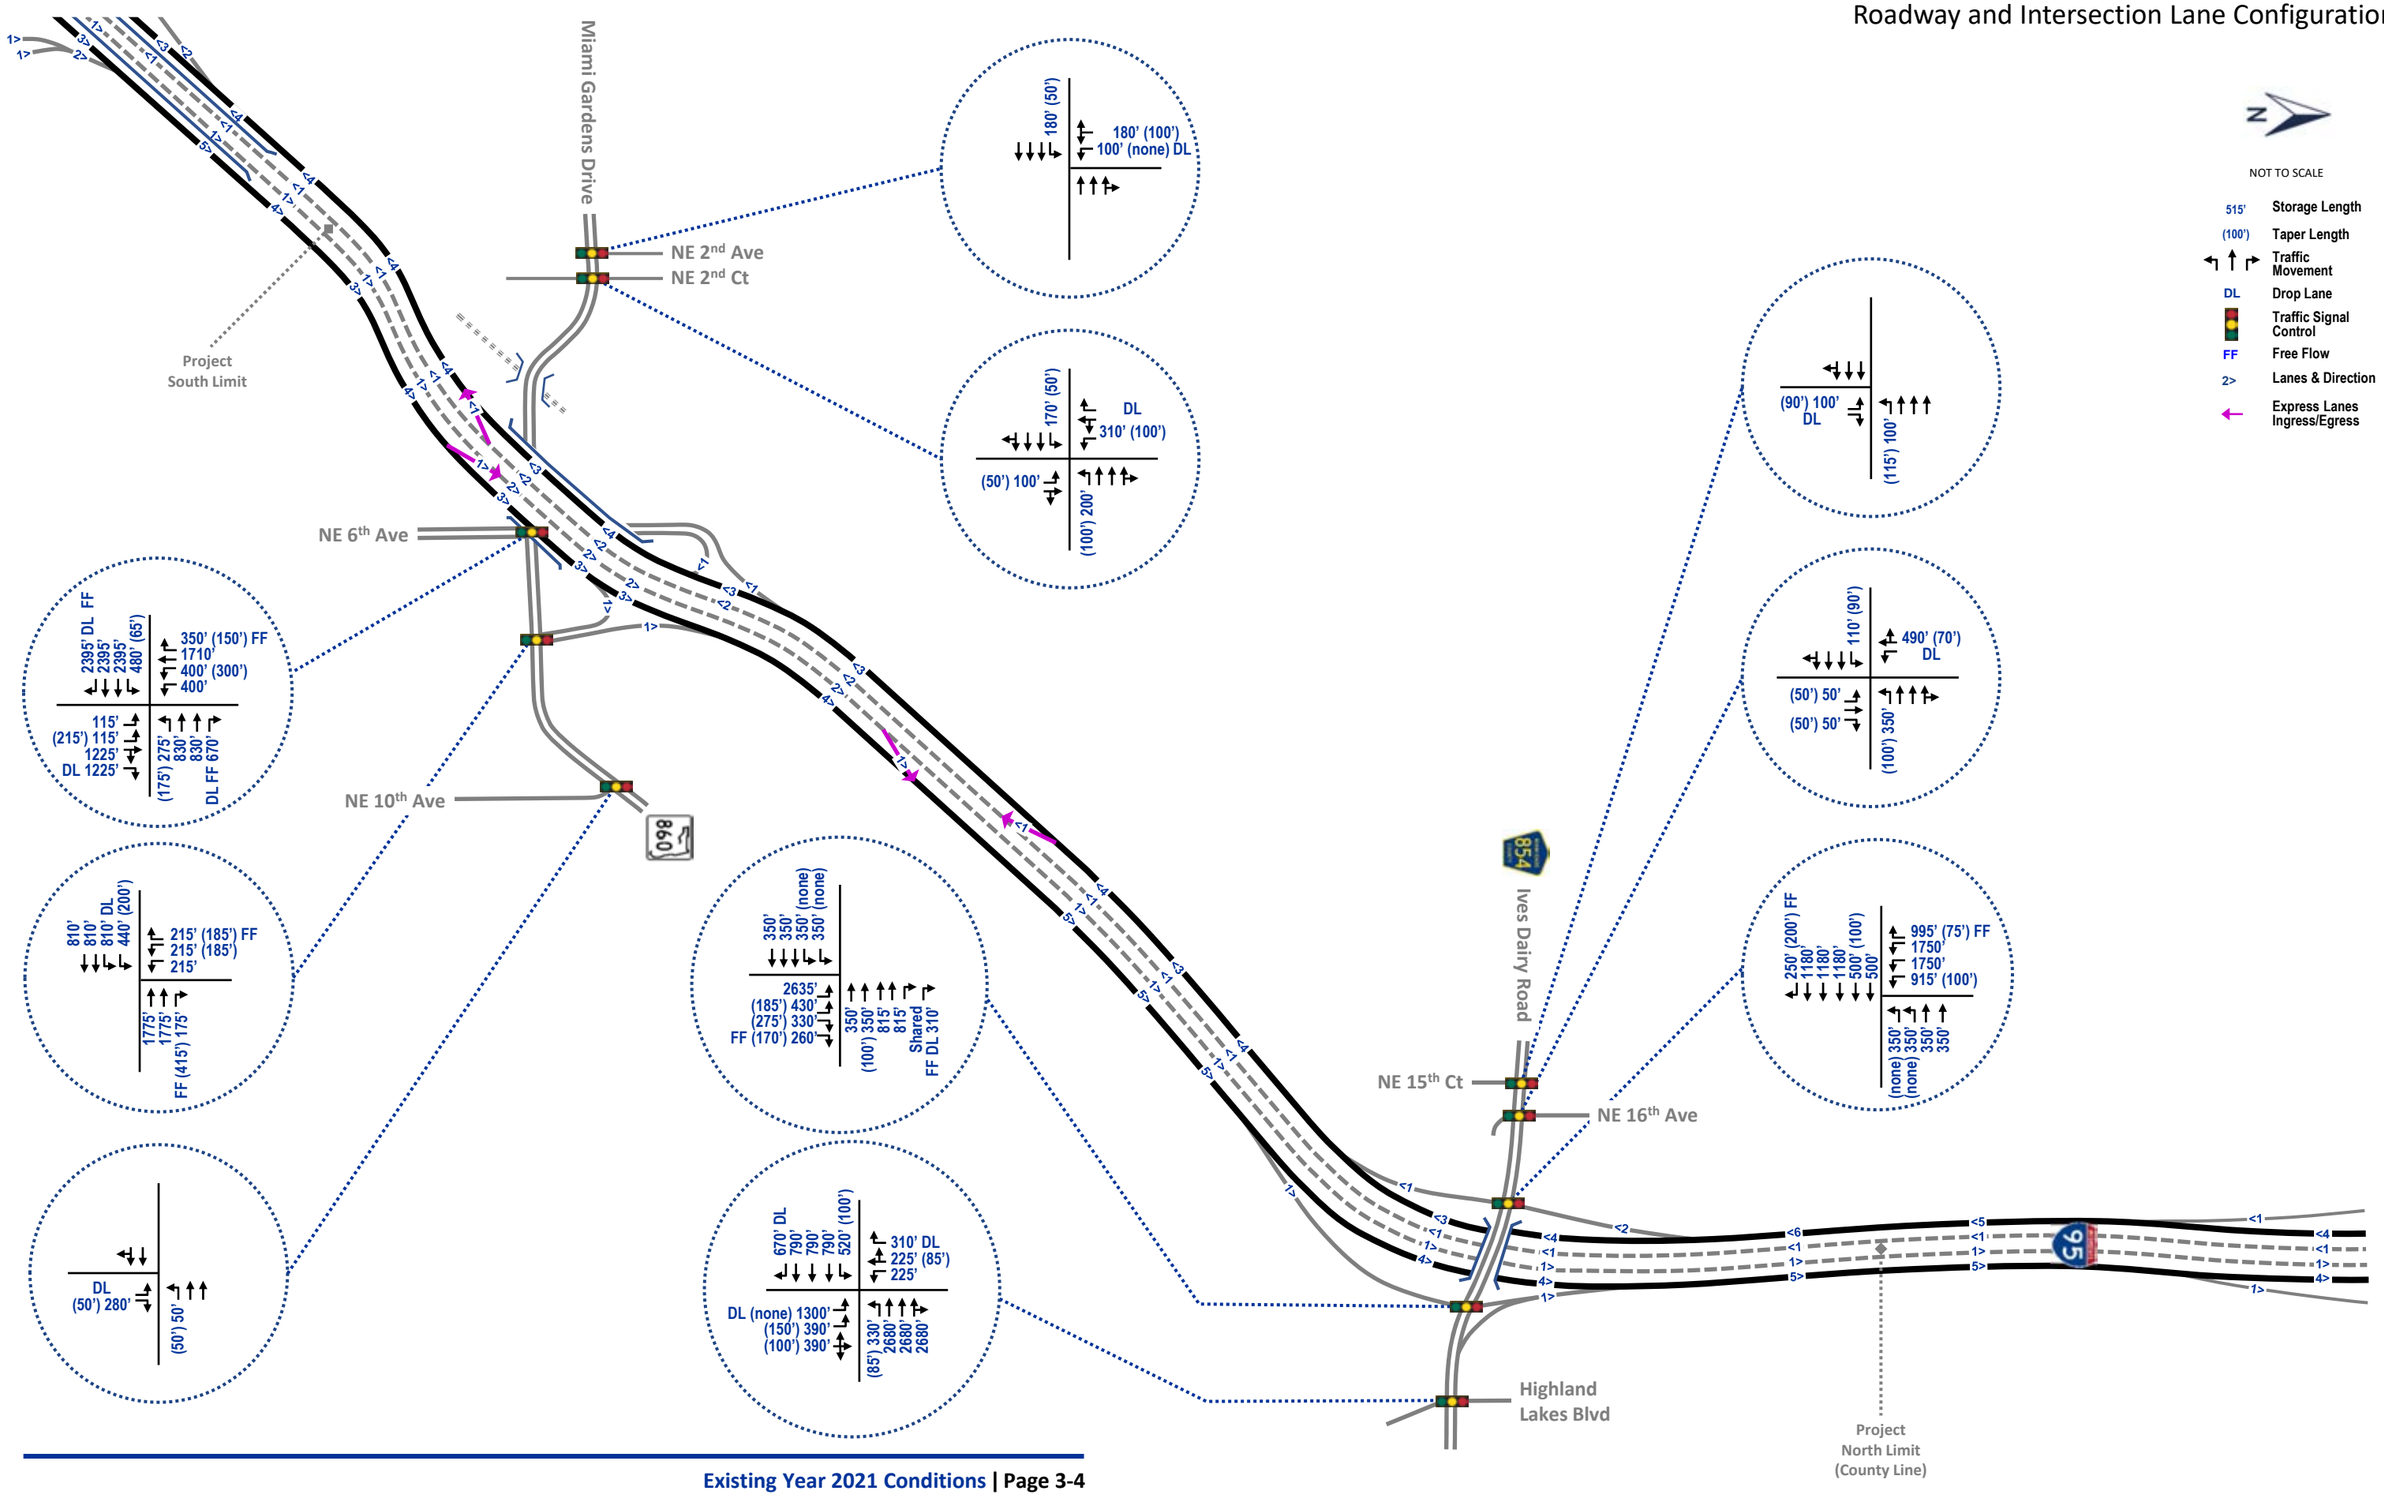
Roadway and Intersection Lane Configuration



3.2.2 SR 860/Miami Gardens Drive from NE 2nd Avenue to NE 10th Avenue

Facility Type: Arterial

Context Classification (Provisional): C3C – Suburban Commercial, west of SR 9/I-95
C3R – Suburban Residential, east of SR 9/I-95

Functional Classification: Urban Minor Arterial

Access Management Classification (FDOT): Class 5

Posted Speed Limit: 40 mph, west of NE 8th Street
30 mph, east of NE 8th Street

Typical Section: EB: 3 Lanes/ Raised Median / WB: 3 Lanes, west of SR 9/I-95
EB: 2 Lanes/ Raised Median / WB: 2 Lanes, east of SR 9/I-95

3.2.3 CR 854/Ives Dairy Road from NE 15 Court to Highland Lakes Boulevard

Facility Type: Arterial

Context Classification (Provisional): Off-System (similar to SR 860/Miami Gardens Drive)
C3C – Suburban Commercial, west of SR 9/I-95
C3R – Suburban Residential, east of SR 9/I-95

Functional Classification: Urban Minor Arterial

Access Management Classification (FDOT: Off-System (similar to SR 860/Miami Gardens Drive)
Class 5

Posted Speed Limit: 40 mph

Typical Section: EB: 3 Lanes/ Raised Median / WB 3: Lanes

3.3 Existing Traffic Data

Traffic data was collected or gathered from different available sources. The following information was gathered within the study area:

- SR 9/I-95 Mainline 72-hour bi-directional vehicle volumes in 15-minute intervals
- Arterial/Ramp 72-hour bi-directional vehicle volumes in 15-minute intervals
- Turning Movement Counts (TMC) in 15-minute intervals (3-hour in the AM and 3-hour in the PM)
- Florida Traffic Online (FTO) 2019, 2020 and 2021 (provided by FDOT in advance of posting) data
- Regional Integrated Transportation Information System (RITIS) volume and speed data
- FDOT Crash Data (Signal Four Analytics)
- *FDOT I-95 Corridor Planning Study from US 1/SR 5 to Broward County Line (FM # 414964-6-22-01)*
- *FDOT I-95 (SR 9) Planning Study from Golden Glades Interchange to I-595 (FM #: 436903-1-22-02)*
- Traffic Signal Information from Miami-Dade County
- Field observations at each signalized intersection

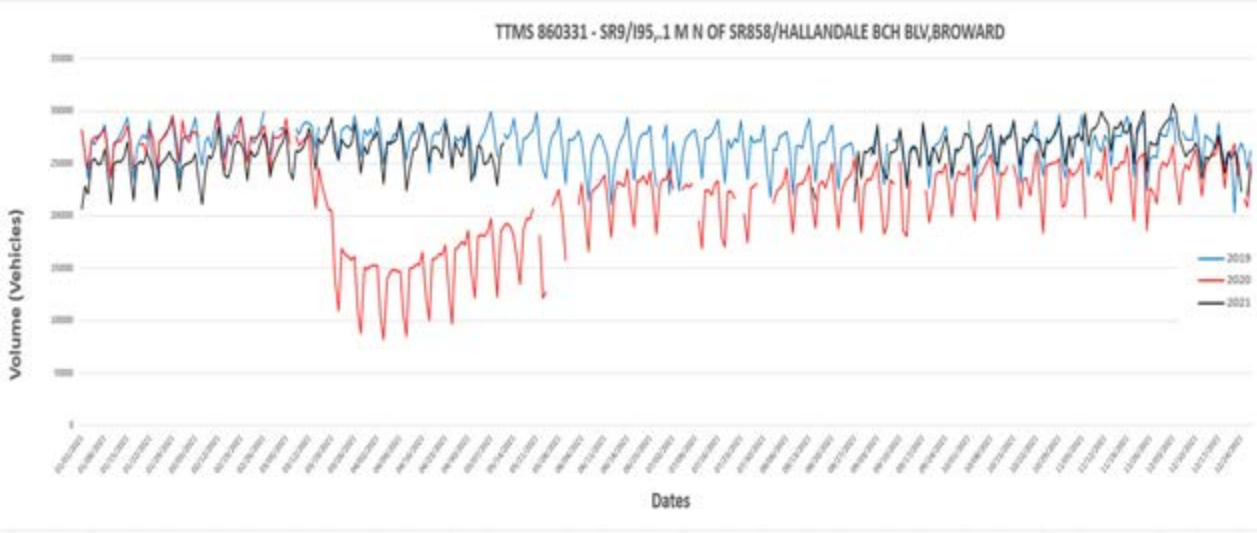
Appendix D presents existing traffic data summaries.

3.4 Existing Traffic Volumes

SR 9/I-95 Mainline 72-hour bi-directional vehicle volumes in 15-minute intervals were obtained from RITIS from Tuesday, September 21, 2021 to Thursday, September 23, 2021. SR 9/I-95 were supplemented with counts from regular FDOT count stations from the Florida Traffic Online (FTO) database. Arterial/Ramp 72-hour bi-directional vehicle volumes and classification in 15-minute intervals were provided by the Department for same period (from Tuesday, September 21, 2021, to Thursday, September 23, 2021). Turning movement counts (TMCs) were provided by the Department. TMCs were collected on Thursday, September 23, 2021 from 6:30 a.m. to 9:30 a.m. and from 3:30 p.m. to 6:30 p.m.

Based on a review of 2019, 2020, and 2021 volume tracking at Count Station Number 86-0331 (the closest permanent count station adjacent to the project), the traffic patterns were deemed to be back to normal prior to the data collection date of September 2021. **Figure 3.4** presents a summary of hourly volumes for years 2019, 2020, and 2021.

Figure 3.4: 2019, 2020, and 2021 Hourly Volumes at Count Station Number 86-0331



Existing Year 2021 volume calculations were coordinated with the adjacent projects to the north within FDOT District 4. The three-day average traffic volumes were used. Link volumes and turning movement counts were balanced between intersections within the project limits. **Figure 3.5** presents a summary of existing volumes. Existing Year 2021 volume calculation summaries are provided in **Appendix E**.

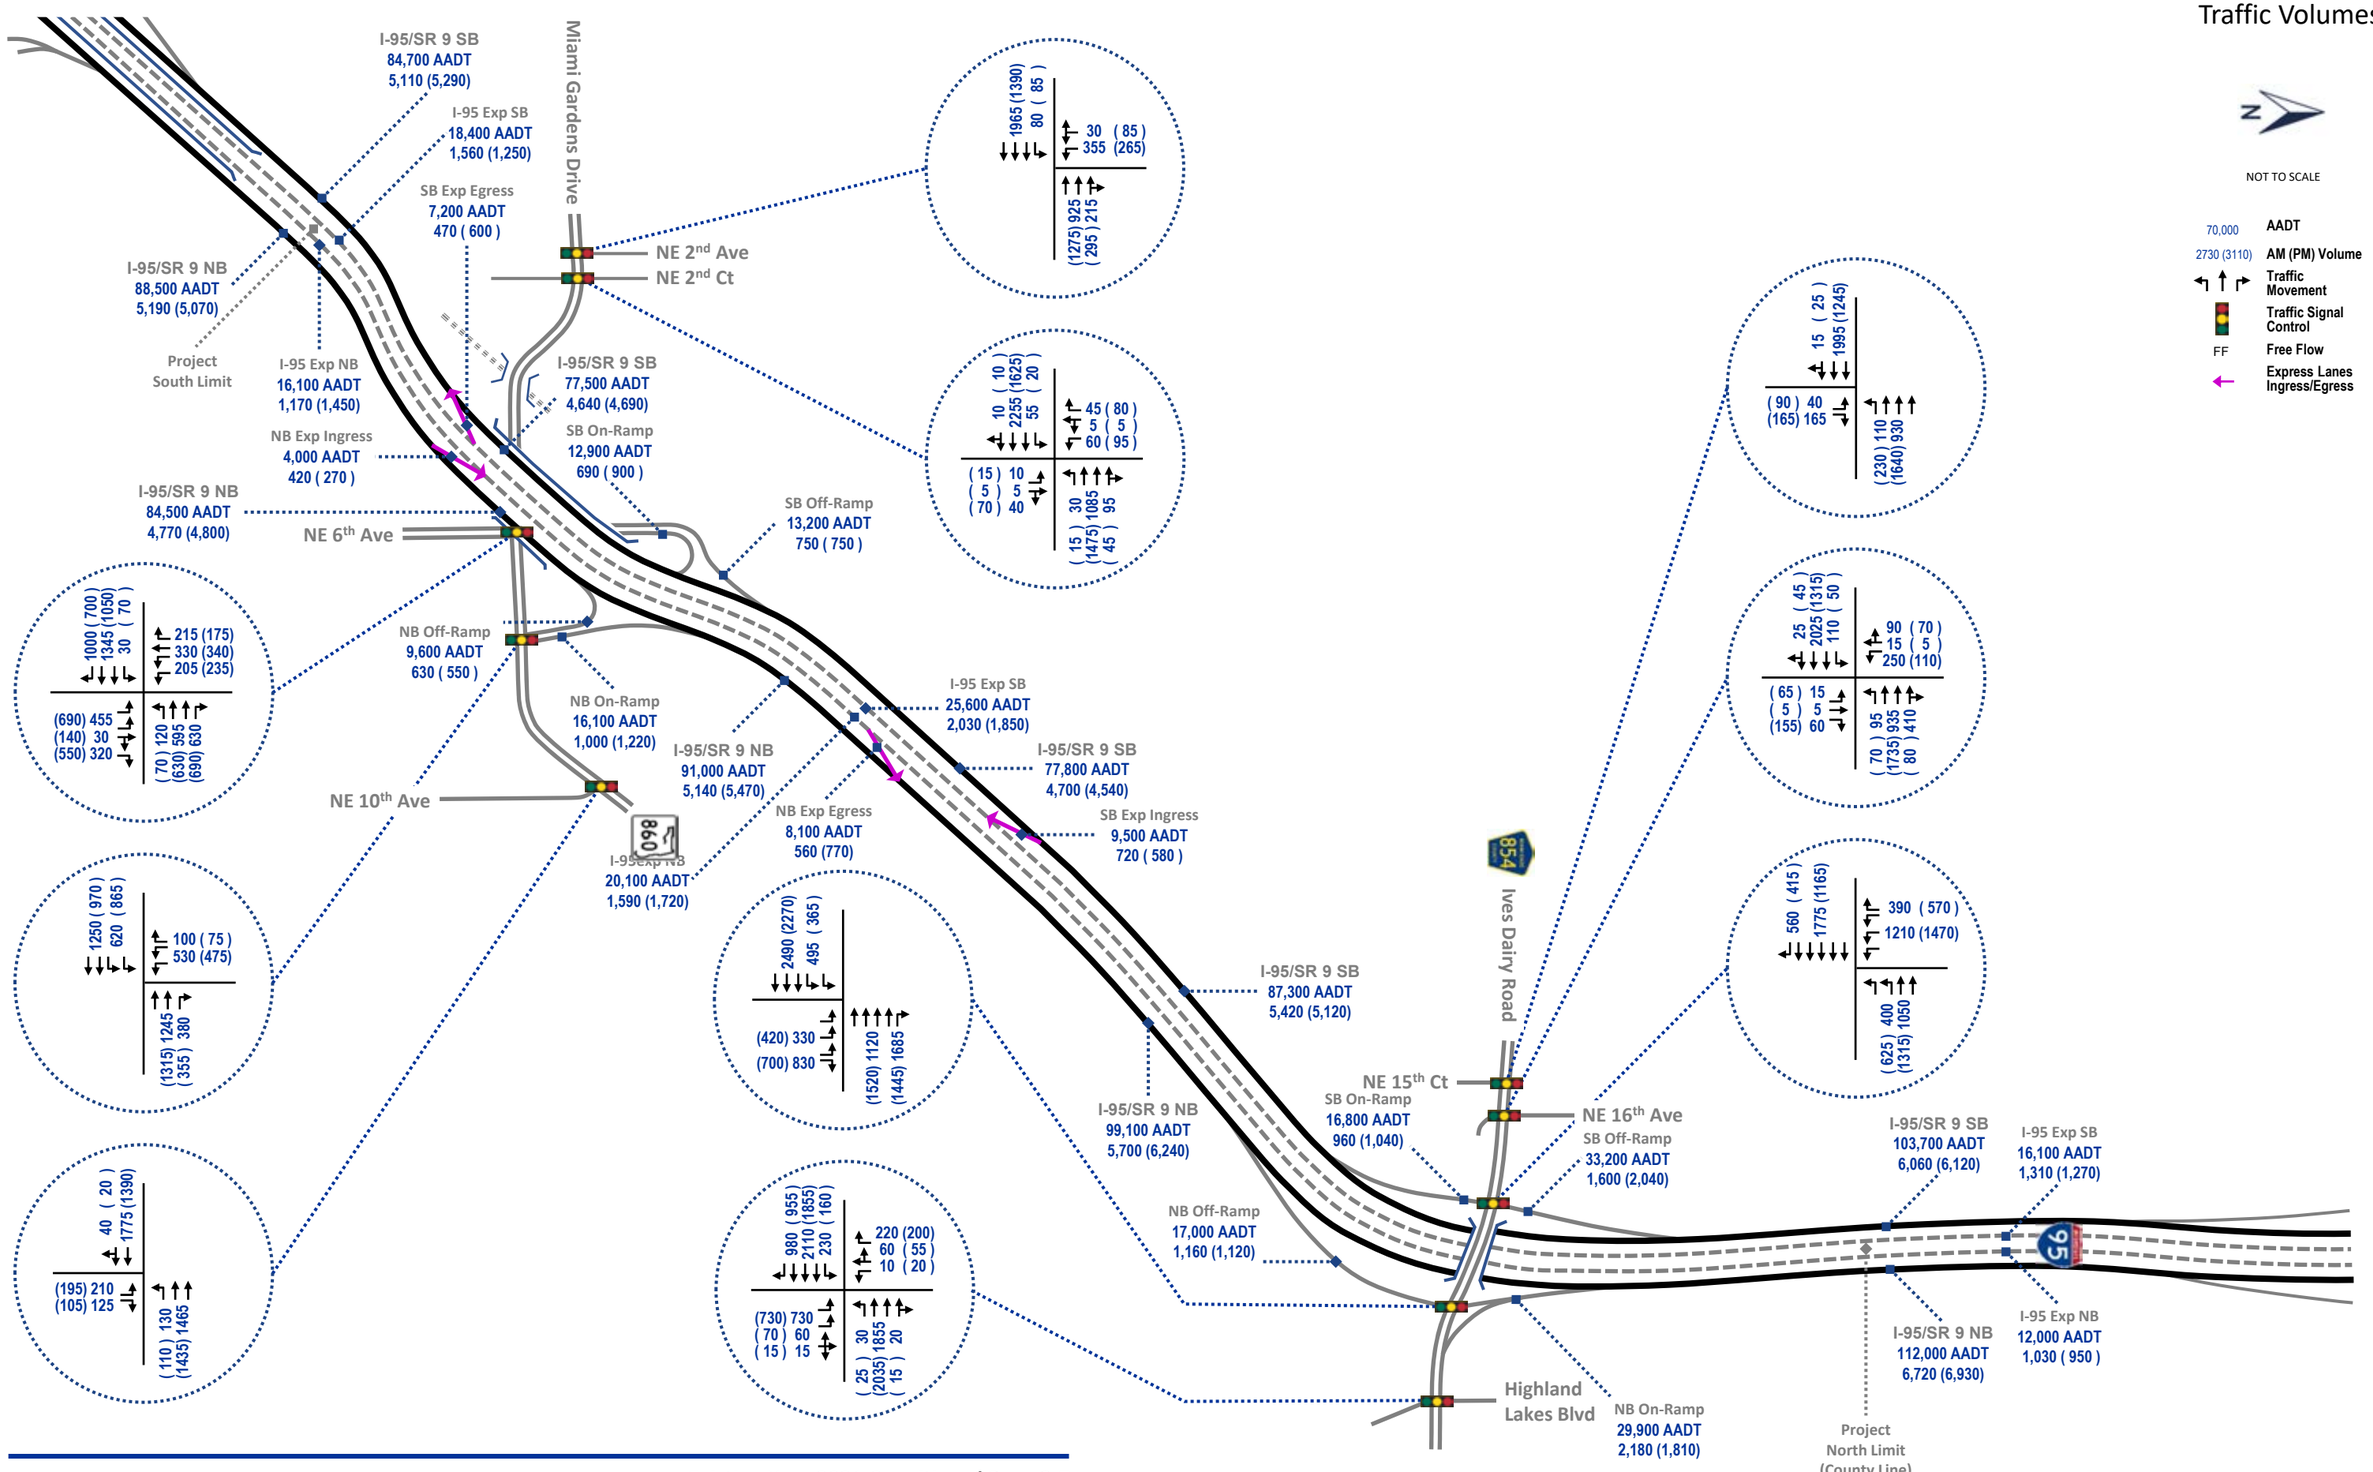
3.5 Existing Traffic Operational Analysis

Traffic operational analysis was conducted to evaluate the existing conditions in the study area. Major analysis parameters include volume, design hour truck (DHT) percentage, and roadway geometry. The calculated DHT values of 3% for SR 9/I-95 and 2% for SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road were used based on existing and historical data. Traffic signal timing information was obtained from the Miami-Dade County Traffic Signals and Signs Division (TS&S) and field checks.

3.5.1 Vissim Freeway, Express Lanes, and Ramp Terminal Intersection Analysis

The operational analysis of the freeway, express lanes, and ramp terminal intersections was performed in accordance with FDOT's Traffic Analysis Handbook using Vissim microsimulation software. The Vissim microsimulation was error checked and calibrated to volume and speed data obtained from FDOT and RITIS databases. Speed calibration parameters indicating adequate calibration as presented in the following section. Similarly, volume calibration parameters are shown in the analysis results figures and tables. **Appendix F** presents the *Vissim Calibration Memorandum for SR 9/I-95 from South of Miami Gardens Drive to North of Miami-Dade/Broward County Line*. The memorandum summarizes the model development and calibration parameters.

Figure 3.5:
Existing Year 2021
Traffic Volumes



A four-hour analysis period was selected to ensure that traffic operations were accurately modeled. The four-hour analysis period provided adequate time for congestion build-up and dissipation. A 30-minute seeding period was coded. The second hour represented the peak hour. Traffic volumes were entered in 15-minute increments as exact values. **Table 3.1** presents the percent of peak hour factors for the analysis.

Table 3.1: Peak Period Vehicle Input Distributions

Hour	Time Interval	AM Period		Time Interval	PM Period	
		Hourly Proportion [1]	Distribution		Hourly Proportion [1]	Distribution
Seeding	6:30	85.55%	19.38%	2:30	88.13%	21.41%
	6:45		23.40%	2:45		22.66%
Pre-Peak (1st)	7:00	92.92%	22.06%	3:00	94.13%	23.00%
	7:15		21.71%	3:15		22.61%
	7:30		23.33%	3:30		23.73%
	7:45		25.82%	3:45		24.79%
Peak (2nd)	8:00	100.00%	25.82%	4:00	100.00%	25.66%
	8:15		24.63%	4:15		25.44%
	8:30		25.29%	4:30		23.84%
	8:45		24.26%	4:45		25.06%
Post Peak (3rd)	9:00	92.99%	24.11%	5:00	96.30%	24.23%
	9:15		23.49%	5:15		24.07%
	9:30		22.69%	5:30		25.08%
	9:45		22.70%	5:45		22.91%
Breaking Hour	10:00	86.09%	20.17%	6:00	98.77%	23.58%
	10:15		21.50%	6:15		25.27%
	10:30		22.43%	6:30		26.24%
	10:45		21.99%	6:45		23.68%

[1]Percent of peak hour

The required number of runs was calculated to be nine (9). However, the Vissim model was conservatively simulated for ten (10) runs, with a simulation resolution of 10-time steps per simulation second. The Vissim microsimulation was error checked and calibrated to volume and speed data obtained from RITIS database. The adjusted Driving Behavior Parameters are presented in the Vissim Calibration Memorandum for SR 9/I-95 from South of Miami Gardens Drive to North of Broward County Line.

A calibration summary of volume (link flows) along SR 9/I-95 during peak hours is presented in **Tables 3.2** and **3.3**, as per the calibration criteria. Traffic volumes for SR 9/I-95 segments in Vissim were obtained from link evaluation output files. Evaluations were based on an average of ten (10) model runs to be conservative. As displayed in Table 3.2., during the year 2021 AM peak hour, all the twenty-two segments (100%) and the sum of all the SR 9/I-95 segments satisfy volume calibration targets. As displayed in Table 3.3, during the year 2021 PM peak hour, all the twenty-two segments (100%) and the sum of all the SR 9/I-95 segments satisfy volume calibration targets.

The model was also calibrated using speed data obtained from HERE/RITIS data (HERE Global B.V. is a company that provides mapping and location data) for the AM and PM peak hours along SR 9/I-95 general-use lanes and express lanes. The simulated speeds derived from data collection points were compared against speed data obtained from RITIS database. **Table 3.4** next page shows comparative results and indicate adequate calibration.

Location 1 – Between SR 858/Hallandale Beach Boulevard and CR 854/Ives Dary Road and Express Lanes Ingress/Egress (FLD6DOT095SB017.4 / FLD6DOT095NB017.4)
Location 2 – Between CR 854/Ives Dary Road and Express Lanes Ingress/Egress (FLD6DOT095SB015.6 / FLD6DOT095NB015.6)
Location 3 – Between CR 854/Ives Dary Road and SR 860/Miami Gardens Drive & Between Express Lanes Ingress/Egress (FLD6DOT095SB015.2 / FLD6DOT095NB015.2)
Location 4a – Between Express Lanes Ingress/Egress and Miami Gardens Drive (FLD6DOT095SB015.1)
Location 4b – Between Express Lanes Ingress/Egress and SR 860/Miami Gardens Drive (FLD6DOT095SB014.9 / FLD6DOT095NB014.9)
Location 5 – Between SR 860/Miami Gardens Drive Ramps (FLD6DOT095SB014.6 / FLD6DOT095NB014.6)
Location 6 – Between Miami Gardens Drive and Golden Glades Interchange (FLD6DOT095SB014.0 / FLD6DOT095NB014.0)

The calibration results of travel speed show that 45 out of 52 spots (86.5%) satisfy the calibration tolerance and are higher than the acceptance threshold of 85%. As such, the model reaches the calibration target of spot speeds. Note that average spot speeds on SR 9/I-95 northbound express lanes are over 70 MPH at three locations (No. 2, 3, and 4) during the AM peak hour. The posted speed limit on locations 2, 3, and 4 is 55 MPH and apparently a lot of drivers are speeding during the AM peak hours. If the average spot speed at these three locations is capped at 65 MPH (10 MPH over the posted speed limit), the acceptance threshold will increase to 92.3%.

Figure 3.6 summarizes the mainline/basic, weaving, and ramp merge/diverge analysis results. **Tables 3.5** and **3.6** summarize the intersection analysis results. The summaries present the second hour of analysis, which corresponds with the peak hour within the analysis period. Documentation of the existing traffic operational analysis is provided in **Appendix G**, which include all 4-hour analysis period. As displayed in Table 3.5, during the year 2021 AM peak hour, all the forty-two (100%) movements satisfy the volume calibration tolerance. As displayed in Table 3.6, during the year 2021 PM peak hour, thirty-nine (93%) movements satisfy the volume calibration tolerance. In total, eighty one out of eighty-four (96%) movements satisfy the volume calibration tolerance, which is higher than the required 85% threshold, as per the calibration criteria in the FDOT Traffic Analysis Handbook, 2021. As such, the Vissim model satisfies the volume calibration target.

The freeway analysis results indicate that all the freeway segments in the study area operate at LOS D or better except for Segment 7 (the two-sided weaving segment between the express lane egress and Exit 12 to US 441, SR 826, and Florida's Turnpike) of the General Use lanes on the southbound direction, which operates as heavily congested during the AM Peak Hour period based on Speed Congestion Level Thresholds. The major cause for the delays is the significant number of vehicles weaving along SR 9/I-95 to maintain a southbound direction to the Golden Glades Interchange and a two-side weaving from Express Lanes to Golden Glades Interchange. Field observations support the analysis results. Similarly, southbound Express Lanes segments 2 and 3 operate as heavily congested during the AM Peak Hour period based on Speed Congestion Level Thresholds. The major cause for the delays is southbound operations from Golden Glades Interchange, outside of the study area. Field observations support the analysis results.

The Vissim ramp terminal intersection analysis (including the intersection of CR 854/Ives Dairy Road at Highland Lakes Boulevard) results indicate that only the intersections of SR 860/Miami Gardens Drive at SR 9/I-95 NB Ramps and CR 854/Ives Dairy Road at SR 9/I-95 NB Ramps operate at LOS D or better. All other intersections operate at LOS E or F during one or both peak hour periods. In addition, there are several movements that operate at LOS E and F, and queuing exceeds available storage. Field observations support the analysis results. As shown in Figure 3.6 and Tables 3.1 and 3.2, target service volumes are met.

3.5.2 Vissim Freeway Complex Weaving Analysis

The Vissim freeway complex weaving analysis is based on Section 8.8 of the *2021 FDOT Traffic Analysis Handbook*. The analysis considers V/C Ratio, Speed Differential and Vehicles Disappearing. The reduction in the capacity to 1,800 vehicles per hour was used to determine the volume to capacity (V/C) ratio for each complex weave segment within the project. The Existing Configuration shows one complex weave segment on each direction, with the critical segments at Segment 1 and Segment 5 for the SB and NB directions, respectively.

The V/C Ratio analysis shows adequate operations with v/c ratios of less than 1.00 for the critical segments. The Speed Differential analysis also indicates adequate operations with speed differences less than 10 mph between weaving and nonweaving movements. However, the Vehicle Disappearing analysis does show volume differences to be more than ten (10) vph, which indicates some congestion as observed on the field. Complex weaving analysis summary worksheets are presented in **Appendix G3.**

3.5.3 Adjacent Intersection Synchro Operational Analysis

The AOI included the adjacent signalized intersections within half-a-mile of the interchanges (i.e., a total of ten (10) intersections). Adjacent intersections were analyzed using Synchro. Based on the results of Synchro analysis, only ramp terminal intersections and the intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard were included in the Vissim microsimulation analysis (i.e., a total of five (5) intersections). The Synchro analysis results for the remaining five (5) adjacent intersections is presented in **Tables 3.7** and **3.8** for the AM and PM peak hours, respectively.

A review of the Synchro queue results indicates that they are consistent with field observations; therefore, a modification of Synchro parameters for calibrations was not required. The Synchro analysis indicates that these five (5) adjacent intersections are not impacted by or impact the operations of the interchanges, which corresponds with field observations. With the exception of the adjacent intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard, queues from the ramp terminal intersections were not observed to reach adjacent intersections, and queues from the adjacent intersections were not observed to reach the ramp terminal intersections during field observation Synchro summary worksheets are presented in **Appendix H.**

3.6 Existing Crash Data Analysis

On April of 2023, the FDOT State Safety Office announced that Signal 4 Analytics (S4) is now the official crash data repository and the sole source of crash information for FDOT Safety Analyses. Therefore, the crash analysis has been updated accordingly. The five most recent years (from January 2019 to December 2023) of crash data was obtained from Signal 4 Analytics. Crash data along SR 9/I-95 was collected between MP 13.724 and 17.199. Crash data along SR 860/Miami gardens was collected between MP 6.030 and 7.105. Crash data along CR 845/Ives Dairy Road was collected between MP 2.305 and 2.887. Historical Crash Maps and statistical summaries are included in **Appendix J**.

There was a total of 4511 reported crashes along SR 9/I-95 within the study area during the 5-year period; 866 occurred in 2019, 834 in 2020, 1077 in 2021, 865 in 2022 and 869 in 2023. Based on crash severity, of the 4511 reported crashes, 3732 (82%) were property damage only crashes, 767 (17%) were injury type crashes, and 12 (0.27%) were fatal crashes. There was a total of 1659 (37%) night/dusk/dawn crashes reported, which is higher than the districtwide average for all roadways of 27 percent; and 794 (18%) of the total crashes occurred under wet/slippery pavement conditions, which is higher than the statewide average for all roadways of 11 percent. Among the contributing causes documented in the crash data, Operated Motor Vehicle in a Careless or Negligent Manner (2250 – 50%) and Failed to Yield Right-Of-Way (302 - 7%) were among the highest. There were nine (9) pedestrian reported crashes. Rear End (2220 - 49%) and Sideswipe (1370 - 30%) crash types had the highest frequencies. **Table 3.9** presents the aggregated summary for SR 9/I-95.

There was a total of 12 fatal crashes along SR 9/I-95 between 2019 and 2023 within the study area. There were four fatal crashes (HSMV# 88528177, 88285286, 88460190, and 88411370) between north of SR 860/Miami Gardens Drive and Express Lane ingress and egress slip ramps. For fatal crash 88528177, Vehicle 1 (V01) was traveling south on SR 9/I-95 north of SR 860/Miami Gardens Drive. Non-motorist 1 (NM01) ran from west to east across all southbound lanes of SR 9/I-95 entering the path of V01. The report states that the pedestrian has been found at fault for causing the crash. For fatal crash 88285286, Vehicle 1 (V01) was traveling north on SR 9/I-95 north of SR 860/Miami Gardens Drive. Non-motorist 1 (NM01) was walking east across all northbound lanes of SR 9/I-95 entering the path of V01. The report states that the pedestrian has been found at fault for causing the crash. For fatal crash 88460190, the report states that there were three vehicles involved in the crash; all traveling south; vehicles 1 (V01) and 2 (V02) on the general purpose lanes, and vehicle 3 (V03) on the express lanes. V01 was following V02 too closely and failed to slow in time, colliding with V02. V01 had faulty brakes. The impact caused V02 to lose control entering the path of V03. The report states that the driver of V01 has been found at fault for causing the crash. For fatal crash 88411370, the report states that prior to this incident, vehicle 1 (V01) was traveling south on the general purpose lanes of SR 9/I-95, north of SR 860/Miami Gardens Drive. V01 lost control, collided with the concrete wall in the median, and entered the express lanes where it came to final rest disabled facing west. Vehicle 2 (V02) was traveling south on SR 9/I-95 approaching SR 860/Miami Gardens Drive entering the express lanes. Unaware that V01 was disabled blocking the express lane after the crash with the wall, V02 failed to stop. The report states that the driver of V02 has been found at fault for causing the crash. A pattern susceptible to correction by roadway modifications was not found for this cluster of crashes.

Table 3.9 – Crash Data Summary SR 9/I-95 2019-2023

Crash Type	2019	2020	2021	2022	2023	Total	Avg	%

There were three fatal crashes (HSMV# 89644998, 89657099, and 88298277) between the Express Lane ingress and egress slip ramps and south of CR 854/Ives Dairy Road interchange. For fatal crash 89644998, the report states that vehicle 1 (V01) and vehicle 2 (V02) were traveling north on the general purpose lane number 4 on SR 9/I-95 south of CR 854/Ives Dairy Road. For unknown reasons, V01 failed to observe V02 and veered on a northwest trajectory colliding with V02. The force of the impact caused V02 to rotate clockwise and rollover multiple times. As a result of the rollover, Driver 2 and the right rear passenger were ejected from V02. For fatal crash 89657099, the report states that that vehicle 1 (V01) and vehicle 2 (V02) were traveling north on the general purpose lanes on SR 9/I-95 approaching CR 854/Ives Dairy Road. The driver of V01 lost control and travel in front of and colliding with V02. As a result of the collision, both vehicles started to travel toward and collided with the wall in the median. For fatal crash 88298277, the report states that that vehicle 1 (V01) and vehicle 2 (V02) were traveling south on the general purpose lanes on SR 9/I-95 south of CR 854/Ives Dairy Road. V01 improperly changed lanes causing a collision with V02. Subsequently, V02 struck the guardrail and overturned. A pattern susceptible to correction by roadway modifications was not found for this cluster of crashes.

There were four fatal crashes (HSMV# 88053755, 88549499, 89581893, and 88224750) between the on- and of ramps of the CR 854/Ives Dairy Road interchange. For fatal crash 88053755, the report states that vehicle 1 (V01) was traveling south on the SR 9/I-95 express lane at the CR 854/Ives Dairy Road interchange. Non-motorist 01 (NM01) was in a previous crash and was standing near the concrete barrier wall. NM01 walked west into the express lane entering the path of V01. For fatal crash 88549499, the report states that vehicle 1 (V01) was traveling north on the SR 9/I-95 general purpose lane at the CR 854/Ives Dairy Road interchange. The driver of V01 failed to maintain control of the vehicle, causing V01 to run off-road into a ditch and striking a tree with left side of the vehicle. For fatal crash 89581893, the report states that vehicle 1 (V01) and vehicle 2 (02) were traveling north on the SR 9/I-95 general purpose lanes at the CR 854/Ives Dairy Road interchange. According to the driver of V02, V01 rear ended V02, both vehicles lost control and run-off roadway, and V01 front collided with a large tree. For fatal crash 88224750, the report states that vehicle 1 (V01) was traveling south on the SR 9/I-95 express lane at the CR 854/Ives Dairy Road interchange. Due to a possible medical event of the driver, V01 run-off road and collided with the barrier wall in the median. A pattern susceptible to correction by roadway modifications was not found for this cluster of crashes.

There was one fatal crash (HSMV# 83799609) north of CR 854/Ives Dairy Road interchange. The fatal crash report states that vehicle 1 (V01) was traveling south on the SR 9/I-95 general lane approaching CR 854/Ives Dairy Road. For unknown reasons, V01 traveled off the roadway, struck a sign support pole, and overturned. It was noted that the driver was not wearing a seat belt.

There was a total of 808 reported crashes along SR 860/Miami Gardens within the study area during the 5-year period; 213 occurred in 2019, 97 in 2020, 130 in 2021, 168 in 2022 and 200 in 2023. Based on crash severity, of the 808 reported crashes, 676 (84%) were property damage only crashes, 130 (16%) were injury type crashes, and 2 (0.25%) were fatal crashes. There was a total of 314 (39%) night/dusk/dawn crashes reported, which is higher than the districtwide average for all roadways of 27 percent; and 114 (14%) of the total crashes occurred under wet/slippery pavement conditions, which is higher than the statewide average for all roadways of 11 percent. Among the contributing causes documented in the crash data, Operated Motor Vehicle in a Careless or Negligent Manner (325 – 40%) and Failed to Yield Right-Of-Way (108 - 13%) were among the highest. There was one (1) pedestrian, and two (2) bicycle reported crashes. Rear End (312 - 39%) and Sideswipe (224 - 28%) crash types had the highest frequencies. **Table 3.10** presents the aggregated summary for SR 860/Miami Gardens.

There was a total of two (2) fatal crashes along SR 860/Miami Gardens between 2019 and 2023 within the study area. The two fatal crashes ((HSMV# 85512055 and 88056447) occurred between the northbound ramp terminal intersection and NE 10th Avenue. For the fatal crash 85512055, the report states that vehicle 1 (V01), a motorcycle, was traveling east along SR 860/Miami Gardens approaching NE 9th Court when it failed to negotiate the curve, traveled off-road, and collided with a tree. For fatal crash 88056447, the report states that vehicle 1 (V01), a motorcycle, was traveling west along SR 860/Miami Gardens approaching a right curve in the roadway. The drive of V01 approached the right curve too fast, failed to negotiate the curve, lost control, run off the road, struck the left curb before going airborne to the eastbound lanes. FDOT has a Safety Project 449362-1, SR 860/Miami Gardens Drive at NW 37th Avenue and from NE 6th Avenue to west of NE 10th Avenue programmed; with right of way land acquisition, right of way support services, preliminary engineering, highway safety construction grants and construction inspection services funds allocated between 2025 and 2027.

There was a total of 663 reported crashes along CR 854/Ives Dairy Road within the study area during the 5-year period; 154 occurred in 2019, 127 in 2020, 153 in 2021, 115 in 2022 and 114 in 2023. Based on crash severity, of the 663 reported crashes, 577 (87%) were property damage only crashes, 85 (13%) were injury type crashes, and 1 (0.15%) was fatal crashes. There was a total of 204 (31%) night/dusk/dawn crashes reported, which is higher than the districtwide average for all roadways of 27 percent; and 83 (13%) of the total crashes occurred under wet/slippery pavement conditions, which is higher than the statewide average for all roadways of 11 percent. Among the contributing causes documented in the crash data, Operated Motor Vehicle in a Careless or Negligent Manner (320 – 48%) and Failed to Yield Right-Of-Way (85 - 13%) were among the highest. There was one (1) pedestrian, and one (1) bicycle reported crashes. Rear End (307 - 46%) and Sideswipe (209 - 32%) crash types had the highest frequencies. **Table 3.11** presents the aggregated summary for CR 854/Ives Dairy Road.

There was one fatal crash (HSMV# 25228048) at the intersection of CR 854/Ives Dairy Road and NE 15th Court. The fatal crash report states that vehicle 1 (V01) was making a left turn from westbound CR 854/Ives Dairy Road to southbound NE 15th Court when vehicle 2 (V02), traveling eastbound, crashed into V01 at a high rate of speed. A witness stated that V01 turn left in front of V02 during traffic crash.

Table 3.11– Crash Data Summary CR 854/Ives Dairy Road 2019-2023

A High Crash Location review was also conducted. The high crash location map and data was obtained for the latest five years 2018 to 2022 of data in Signal 4 Analytics, which is one year behind other crash data. The analysis uses crash coefficient levels over 99.99 %, safety ratios over 1.00 and a minimum count of eight crashes to establish and rank high crash urban locations. The analysis indicates that the majority of the study area is within a high crash segment along SR 9/I-95. Listed below and shown in **Figure 3.7** are the High Crash Segments along SR 9/I-95, SR 860/Miami Garden Drive and CR 854/Ives Dairy Road within the study area.

High Crash Segment Locations on SR 9/I-95:

- Between MP 13.110 and MP 14.501:
  North of the GGI and south of the SR 860/Miami Gardens Drive interchanges.
- Between MP 14.633 and MP 16.087:
  North of the SR 860/Miami Garden Drive and south of the CR 854/Ives Dairy Road interchanges.

High Crash Segment and Intersection Locations on SR 860/Miami Garden Drive:

- Between MP 6.098 and MP 6.558:
  Between NE 2nd Court and NE 6th Avenue intersections.
  - There is a FDOT Resurfacing Project 447801-1 between NW 2nd Avenue and NE 5th Avenue intersections
  - There is a FDOT Safety Project 449362-1 between NE 6th Avenue and NE 10th Avenue intersections
- No intersections

High Crash Segment and Intersection Locations on CR 854/Ives Dairy Road:

- None

The crash data shows a concentration within the areas with higher traffic friction (i.e., merge, diverge, and weaving), including the access points to and from the Express Lanes. The safety analysis indicates that Rear End and Sideswipe crash types had the highest frequencies; these types of crashes are consistent with reoccurring congestion. The main purpose of this project is to address the deficient operational capacity and relieve existing/future congestion along the SR 9/I-95 corridor and its interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, which in turn will improve safety and reduce travel time.

Night/dusk/dawn time type crashes exceed the districtwide average of 27% along the SR 9/I-95, SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road corridors within the study area. A lighting assessment and necessary improvements are recommended. To improve safety along the SR 9/I-95 study corridor, the following improvements were recommended for consideration: implement an additional express lane in each direction; implement braided ramps; implement general use and auxiliary lanes; and reduce friction areas. To improve safety along SR 860/Miami Garden Drive, the following improvements were recommended for consideration: The FDOT Resurfacing Project 447801-1 between NW 2nd Avenue and NE 5th Avenue intersections will reduce rear end, sideswipe, and Off Road type crashes. Interchange configuration modifications at NE 6th Avenue into a Continuous Green T (CGT) and NB Ramps at SR 860/Miami Gardens Drive into grade separation will reduce conflicts significantly. To improve safety along CR 854/Ives Dairy Road, it is recommended that the interchange configuration be changed to a Diverging Diamond to reduce conflicts.

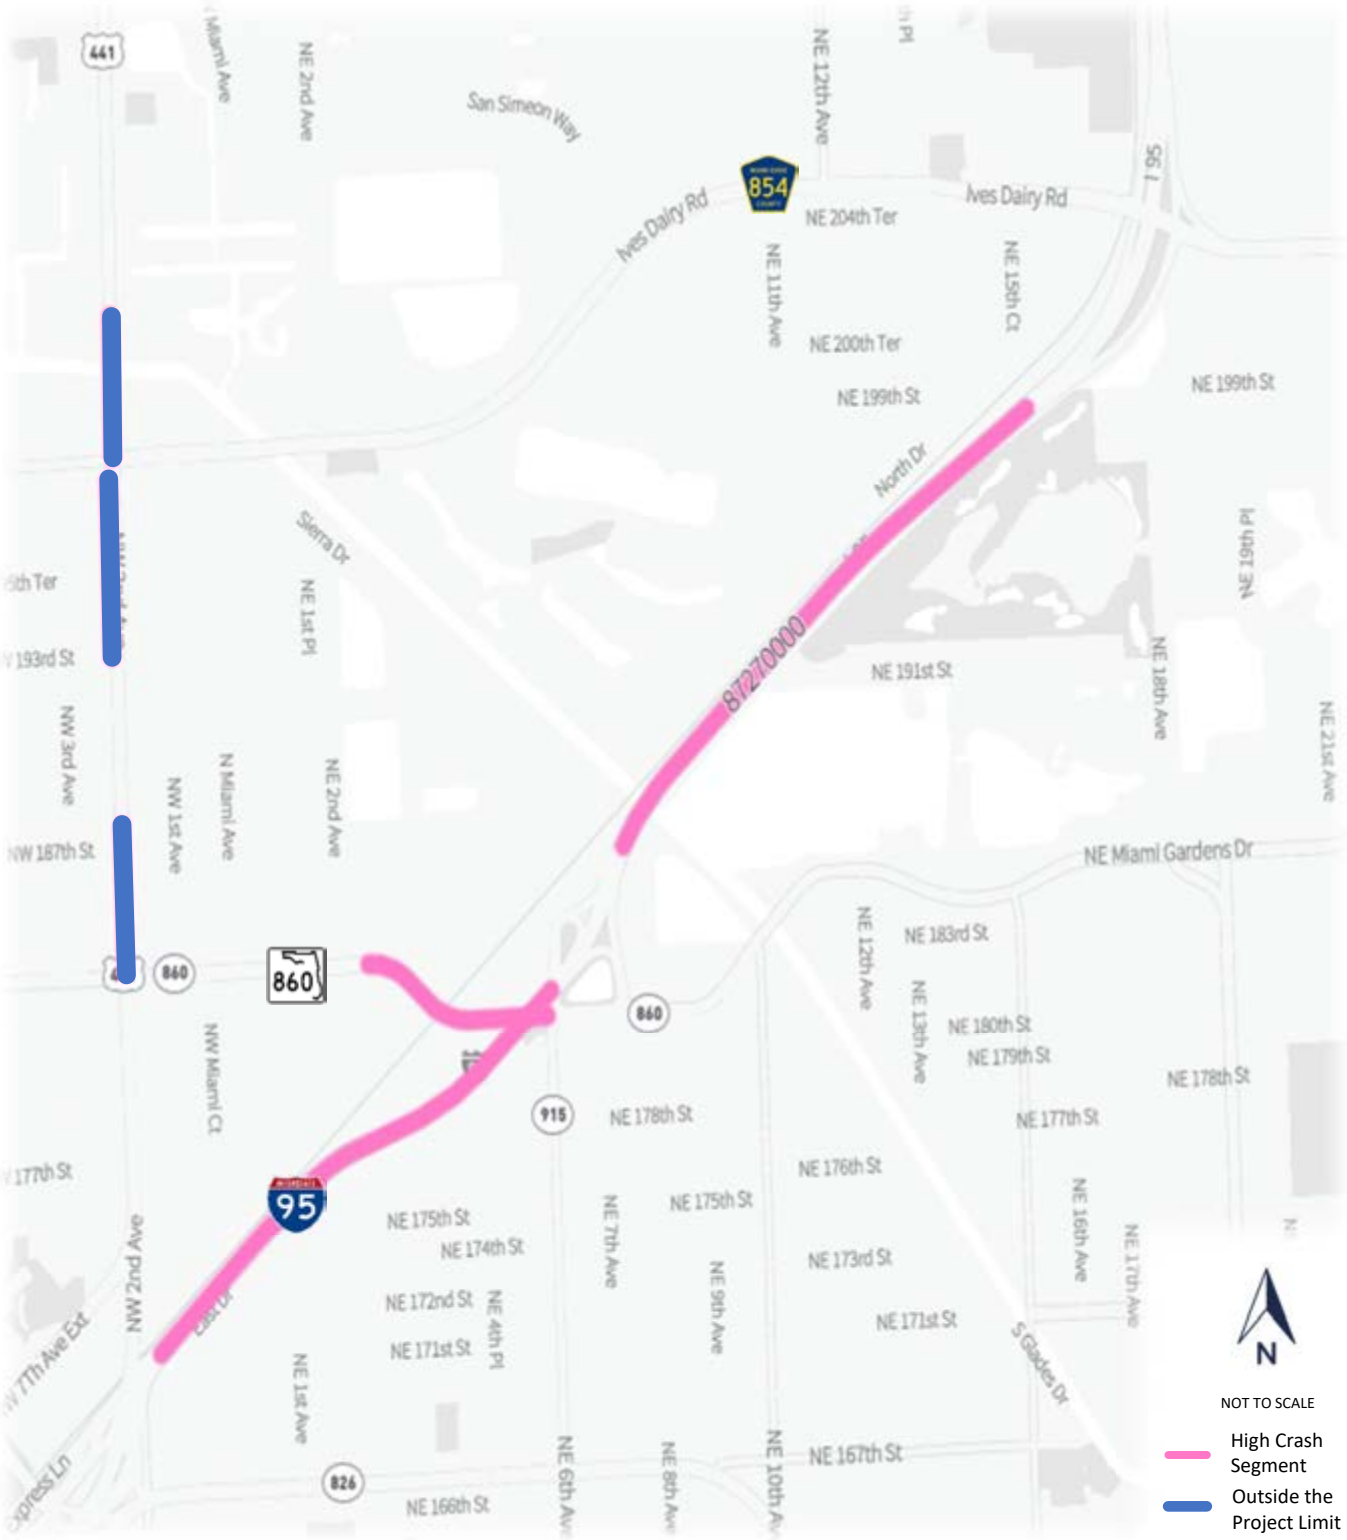

Figure 3.7:
High Crash Location Segments

At the request of the City of Aventura, pedestrian and bicycle crash data was obtained near the Dr Michael Krop Senior High School and Highland Oaks Middle School abutting the study area to assess crashes involving school age children. A review of the crash data indicates that there was a total of eleven (11) crashes involving a pedestrian or bicyclist between 2016 and 2023. The study area and years for analysis were determined based on the request from the City of Aventura. One crash occurred in 2016, and two crashes during each year thereafter. One of the crashes in 2018 was first a rear end crash between two vehicles. Then, one of the vehicles was forced off the road into the path of a pedestrian walking on the shoulder towards his disabled vehicle. The crash locations are shown in **Figure 3.8**.

Dr Michael Krop Senior High School is on Phase 2 bell schedule from 7:20 am to 2:20 pm. Highland Oaks Middle School is on a bell schedule from 9:10 am to 3:50 pm, with breakfast from 8:05 to 9:00 am and after school activities from 4:00 pm to 5:00 pm. Of the eleven crashes, only one occurred between 8:00 am and 4:00 pm. This crash involved a school age child. The other ten (10) crashes occurred before or after school hours. Two crashes involved school age children: one at the intersection of CR 854/Ives Dairy Road and NE 16th Avenue, and the other at the intersection of CR 854/Ives Dairy Road and NE 24th Avenue. Both intersections are signalized with pedestrian signal heads and push buttons, and the contributing cause was the failure to yield the right-of-way. In one crash, the pedestrian failed to yield the right-of-way; in the other crash a right-turning vehicle failed to yield the right-of-way. The data does not indicate a crash pattern.

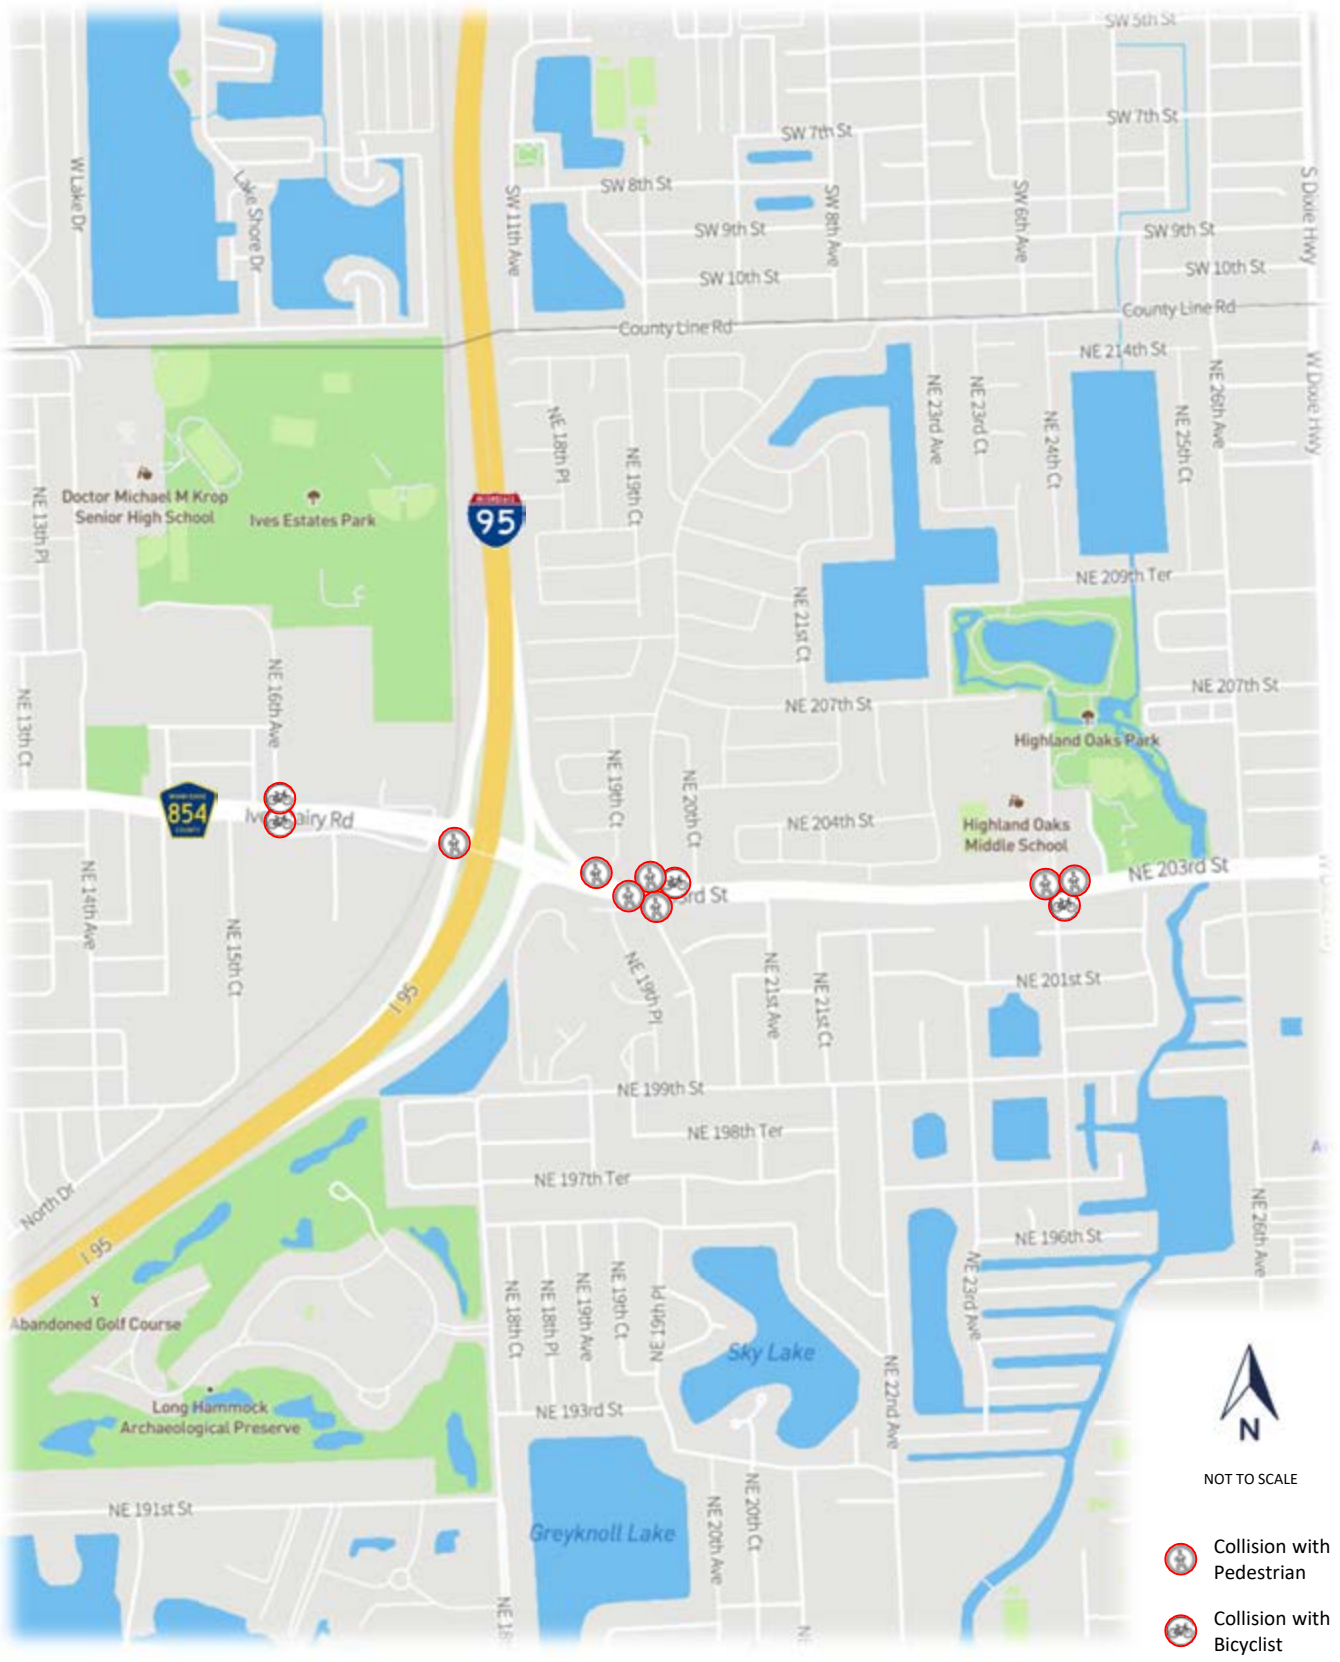

Figure 3.8:
CR 854/Ives Dairy Road – Collisions with Pedestrian or Bicyclist 2016-2022

4 DESIGN CONCEPTS

The No-Build and Build alternatives were analyzed. The No-Build alternative was developed from existing conditions plus any committed projects in the adopted Metropolitan Planning Organization (MPO) Transportation Improvement Program (TIP), Statewide Transportation Improvement Program (STIP), Local Government Comprehensive Plan (LGCP), MPO LRTP and Cost Feasible Plan (CFP), FDOT's Adopted Five-Year Work Program, SIS Second Five-Year Work Program and SIS Modal Plan.

The proposed improvements for Build alternatives 1 and 2 stemmed from the Refined Build Concepts that were developed as part of the *Interstate 95 Corridor Planning Study*. The study's preferred alternative was recommended for further consideration in the Project Development phase to provide additional capacity while minimizing modifications to programmed/planned improvements pertaining to other projects along the SR 9/I-95 corridor, as well as to reduce right-of-way acquisition/impacts and construction costs. A third enhanced Alternative was developed and analyzed incorporating the best features of Build Alternatives 1 and 2 and improvements from the analysis results of the first two alternatives. A stand-alone TSM&O Alternative was not developed since it would not be able to address the purpose and need of the project. Development of the conceptual design alternatives followed Context Sensitive Solution and Complete Streets approaches.

4.1 Future Land Use Changes

As previously stated, the west side of the SR 9/I-95 at SR 860/Miami Gardens Drive Interchange is located within unincorporated Miami-Dade County; the east side of the interchange is located within the City of North Miami Beach. The SR 9/I-95 at CR 854/Ives Dairy Road Interchange is located within unincorporated Miami-Dade County. **Appendix J** presents the Miami-Dade County Adopted 2030-2040 Comprehensive Development Master Plan and the City of North Miami Beach Comprehensive Plan – Future Land Use Map, for ease of reference. No significant future land use changes were identified in the project area. The maps show the following zone classifications for each of the interchanges:

4.1.1 SR 860/Miami Gardens Drive

- Residential Low Density at the NE and SE quadrants of the interchange; and
- Industrial and Office at the NW and SW quadrants of the interchange.

4.1.2 CR 854/Ives Dary Road

- Low Density Residential at the NE and SE quadrants of the interchange; and
- Industrial and Office at the NW and SW quadrants of the interchange.

4.2 Travel Demand Forecasting

The project traffic was developed based on 2019 FDOT Project Traffic Forecasting Handbook procedures; including the utilization of time-of-day volumes (i.e., applying diurnal factors as opposed to applying standard K and D factors), consistent with previous and on-going projects in the area. Horizon year 2045 No-Build scenario was modeled. Build Alternatives 1, 2, and 3 were developed by reassigning the 2050 No-Build volumes to each of the Build Alternatives based on the origin-destination and modified roadway network information. For Design Year 2050, traffic volumes were extrapolated from future year 2045. For opening year 2030, traffic volumes were interpolated between Existing Year 2021 and Design Year 2050. Turning movement volumes were developed for the analyses of AM and PM peak periods using the FDOT TMTool. Volumes were checked for reasonableness and balanced.

The Southeast Florida Regional Planning Model (SERPM), Version 8.513 has been used for this project. The SERPM 8.513 is an Activity-Based Model (ABM) that simulates both household-level and person-level travel choices including intra-household interactions with household members. SERPM 8.513 model is validated to Year 2015 conditions and includes a future year 2045 scenario based on the adopted Cost Feasible plans from Miami-Dade TPO, Broward MPO, and Palm Beach Transportation Planning Agency (TPA). It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. A subarea validation was conducted, including SR 9/I-95 mainline, interchange ramps and arterial segments within the AOI. Volume-Over-Count (V/C) Ratio targets were used to evaluate the model validation outputs. The subarea validation indicates that the SR 9/I-95 V/C Ratio of 4% is within the Freeway Volume-Over-Count Preferable Standard of +/- 6%; however, the SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road V/C Ratio of 25% is over the Divided Arterial Volume-Over-Count Acceptable Standard of +/- 10%. The measure of dispersion, Root Mean Square Error (RMSE) is 5% for SR 9/I-95 mainline, 10% for SR 9/I-95 mainline and ramp, and 49% for the arterials. **Tables 4.1** shows the subarea validation for SR 9/I-95. The subarea validation for the arterials CR 854/Ives Dairy Road, SR 860/Miami Gardens Drive and NE 6th Avenue is shown in **Tables 4.2**.

Table 4.1 – Subarea Validation SR 9/I-95

Interchange / Mainline	Location	FDOT Count Station	FDOT 2015 AADT	SERPM 2015 AADT	2015 SERPM Count Difference	2015 Volume-Over-Count (V/C) Ratio

			220,000	274,000	-54,000	25%

A 2021 SERPM model scenario was not developed by recreating a 2021 roadway network and interpolating 2021 socioeconomic data between the 2015 and 2045 socioeconomic data sets as stated in the MLOU. Instead, 2021 model volumes were developed by interpolating between the 2015 and 2045 model volumes. As stated in NCHRP Report 765, the results will probably be similar in most cases. We anticipate that will be the case for this project due to the several constrains of the existing and potential roadway networks.

The model future year is the regional LRTP horizon year of 2045. The 2045 No-Build network was developed in close coordination with FDOT District 4 and District 6 Project Managers and District 4's SR 9/I-95 PD&E from SR 858/Hallandale Beach Boulevard to Hollywood Boulevard Team. The 2045 No-Build network was built by incorporating the Locally Preferred Alternative (LPA) from the SR 9/I-95 Corridor Planning Study and Golden Glade Interchange (GGI) Ultimate Design as provided by FDOT.

A future year (2045) no-build network in Southeast Florida Regional Planning Model (SERPM) was developed based on the 2045 Cost Feasible Plans adopted by the three planning institutions in the region. The socioeconomic data, network coding, and other model settings were reviewed to make sure they are consistent with subsequent changes. The following three projects were included:

- 4056154 - SR 25/Okeechobee Road and SR 932/NW 103rd Street at NW 87th Avenue: Add turn lane.
- 4217072 - SR 93/I-75 Managed Lanes System from NW 170th Street to S of HEFT Interchange: Add special use lane.
- 4326871 - SR 826 from Flagler Street to NW 154th Street & I-75 from SR 826 to NW 170th Street: Add special use lane.

The no-build network also includes the proposed improvements from the aforementioned projects in coordination with the Department.

Future year link volumes were adjusted using two factors: the ratio of the actual base year traffic count to the base year model volume and the numerical difference between the actual base year traffic count and the base year model volume. The growth rates of the SERPM forecasted volumes were compared against historical growth trends from FDOT count stations within the study area and Socioeconomic growth rates from population/employment data within the 2-mile buffer around study interchanges from model Base Year 2015 to model Forecast Year 2045. The Trend analysis indicates a maximum growth rate of 1.37% and a minimum growth rate of -1.32% within SR 9/I-95; and a maximum growth rate of 1.80% and a minimum growth rate of -0.30% within the two arterials. The Socioeconomic analysis indicates a maximum growth rate of 1.3% and a minimum growth rate of 0.06%. Any outlier links were postprocessed. In addition, the ratio and difference adjustments were checked against a minimum growth rate of 0.5% per year for reasonableness. After adjustments there were still 17 of 33 links that resulted in a model growth rate of less than 0.5% per year; therefore, the minimum growth rate of 0.5% per year was used for those 17 links.

Traffic projections for Opening Year 2030 and Design Year 2050 were developed for both, the AM and PM peak hour periods. DDHVs were developed using the FDOT D4 TMTool based on methodologies presented on the *2021 FDOT Project Traffic Forecasting Handbook*. The volumes were balanced and smoothed as needed. **Appendix K** presents the *Traffic Data & Projections Memorandum,* which provides projected volume calculations and additional background information. The following sections present the roadway transportation networks and traffic demand forecasts for each alternative.

4.3 No-Build Alternative – Transportation Network & Traffic Volume Projections

The No-Build Alternative maintains the existing corridor as it is today with no future major improvements other than routine maintenance. Planned and approved adjacent projects in the area (both to the south at the Golden Glades Interchange and to the north in Broward County) are considered and included in the microsimulation analysis; however, there are no proposed changes within the limits of this project. Per coordination with the Department, the Golden Glades Interchange – Brown Project has been placed on hold; therefore, it was not included in the No-Build Alternative. No traffic capacity, operation, safety, mobility, or evacuation improvements would be implemented to the SR 9/I-95 mainline, the Express Lanes, or the two arterials within the study area. The effect of the No-Build Alternative includes the continuation of existing delays and congested traffic conditions. The No-Build Alternative serves as a baseline comparison against the proposed Build Alternatives. **Figure 4.1** presents the Future No-Build Alternative Lane Configuration. Traffic volume projections are presented in **Figures 4.2** and **4.3** for opening and design years, respectively.

4.4 Build Alternative 1 – Transportation Network & Traffic Volume Projections

Alternative 1 is based on the *FDOT District 6 SR 9/I-95 Corridor Planning Study (FM: 414964-6-22-01)*, which evaluated a series of concepts and ultimately refined from 45 initial alternatives to two corridor wide concept alternatives referred as Build Concept 1 and Build Concept 2. Based on the results of the evaluation of Build Concepts 1 and 2 and input from FDOT District 6 staff, a refined or final concept referred to as Refined Build Concept was developed, which is further evaluated as Build Alternative 1 for this PD&E Study.

SR 9/I-95 Mainline and Express Lanes - Alternative 1 proposes a typical section consisting of two continuous express lanes, four general purpose lanes, and one auxiliary lane in each direction from north of the Golden Glades Interchange to the Broward County line. Within the project limits, for Alternative 1 there will continue to be two express lane ingress points. One will be located in the northbound direction between the northbound off- and on-ramps of SR 860/Miami Gardens Drive interchange and the other will be located in the southbound direction north of Snake Creek Canal. There will also continue to be two express lane egress points. One will be located in the southbound direction, south of SR 860/Miami Gardens Drive providing access to the Golden Glades Interchange; and the other in the northbound direction, north of Snake Creek Canal providing access to CR 854/Ives Dairy Road and southern Broward County.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location for both northbound and southbound on and off ramps. This single ramp terminal intersection would be located at the existing ramp terminal intersection on the east side of the SR 9/I-95 corridor with an expanded Turbo 'T' intersection. The existing signalization conditions will remain in place. The eastbound dual left turn lanes are proposed to remain at-grade similar to existing conditions.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound lane is provided to help reduce the congestion of traffic in the area.

Figure 4.4 presents the Future Build Alternative 1 Lane Configuration. Build Alternative 1 Traffic volume projections are presented in **Figures 4.5** and **4.6** for opening and design years, respectively.

Build Alternative 1
Roadway and Intersection Lane Configuration

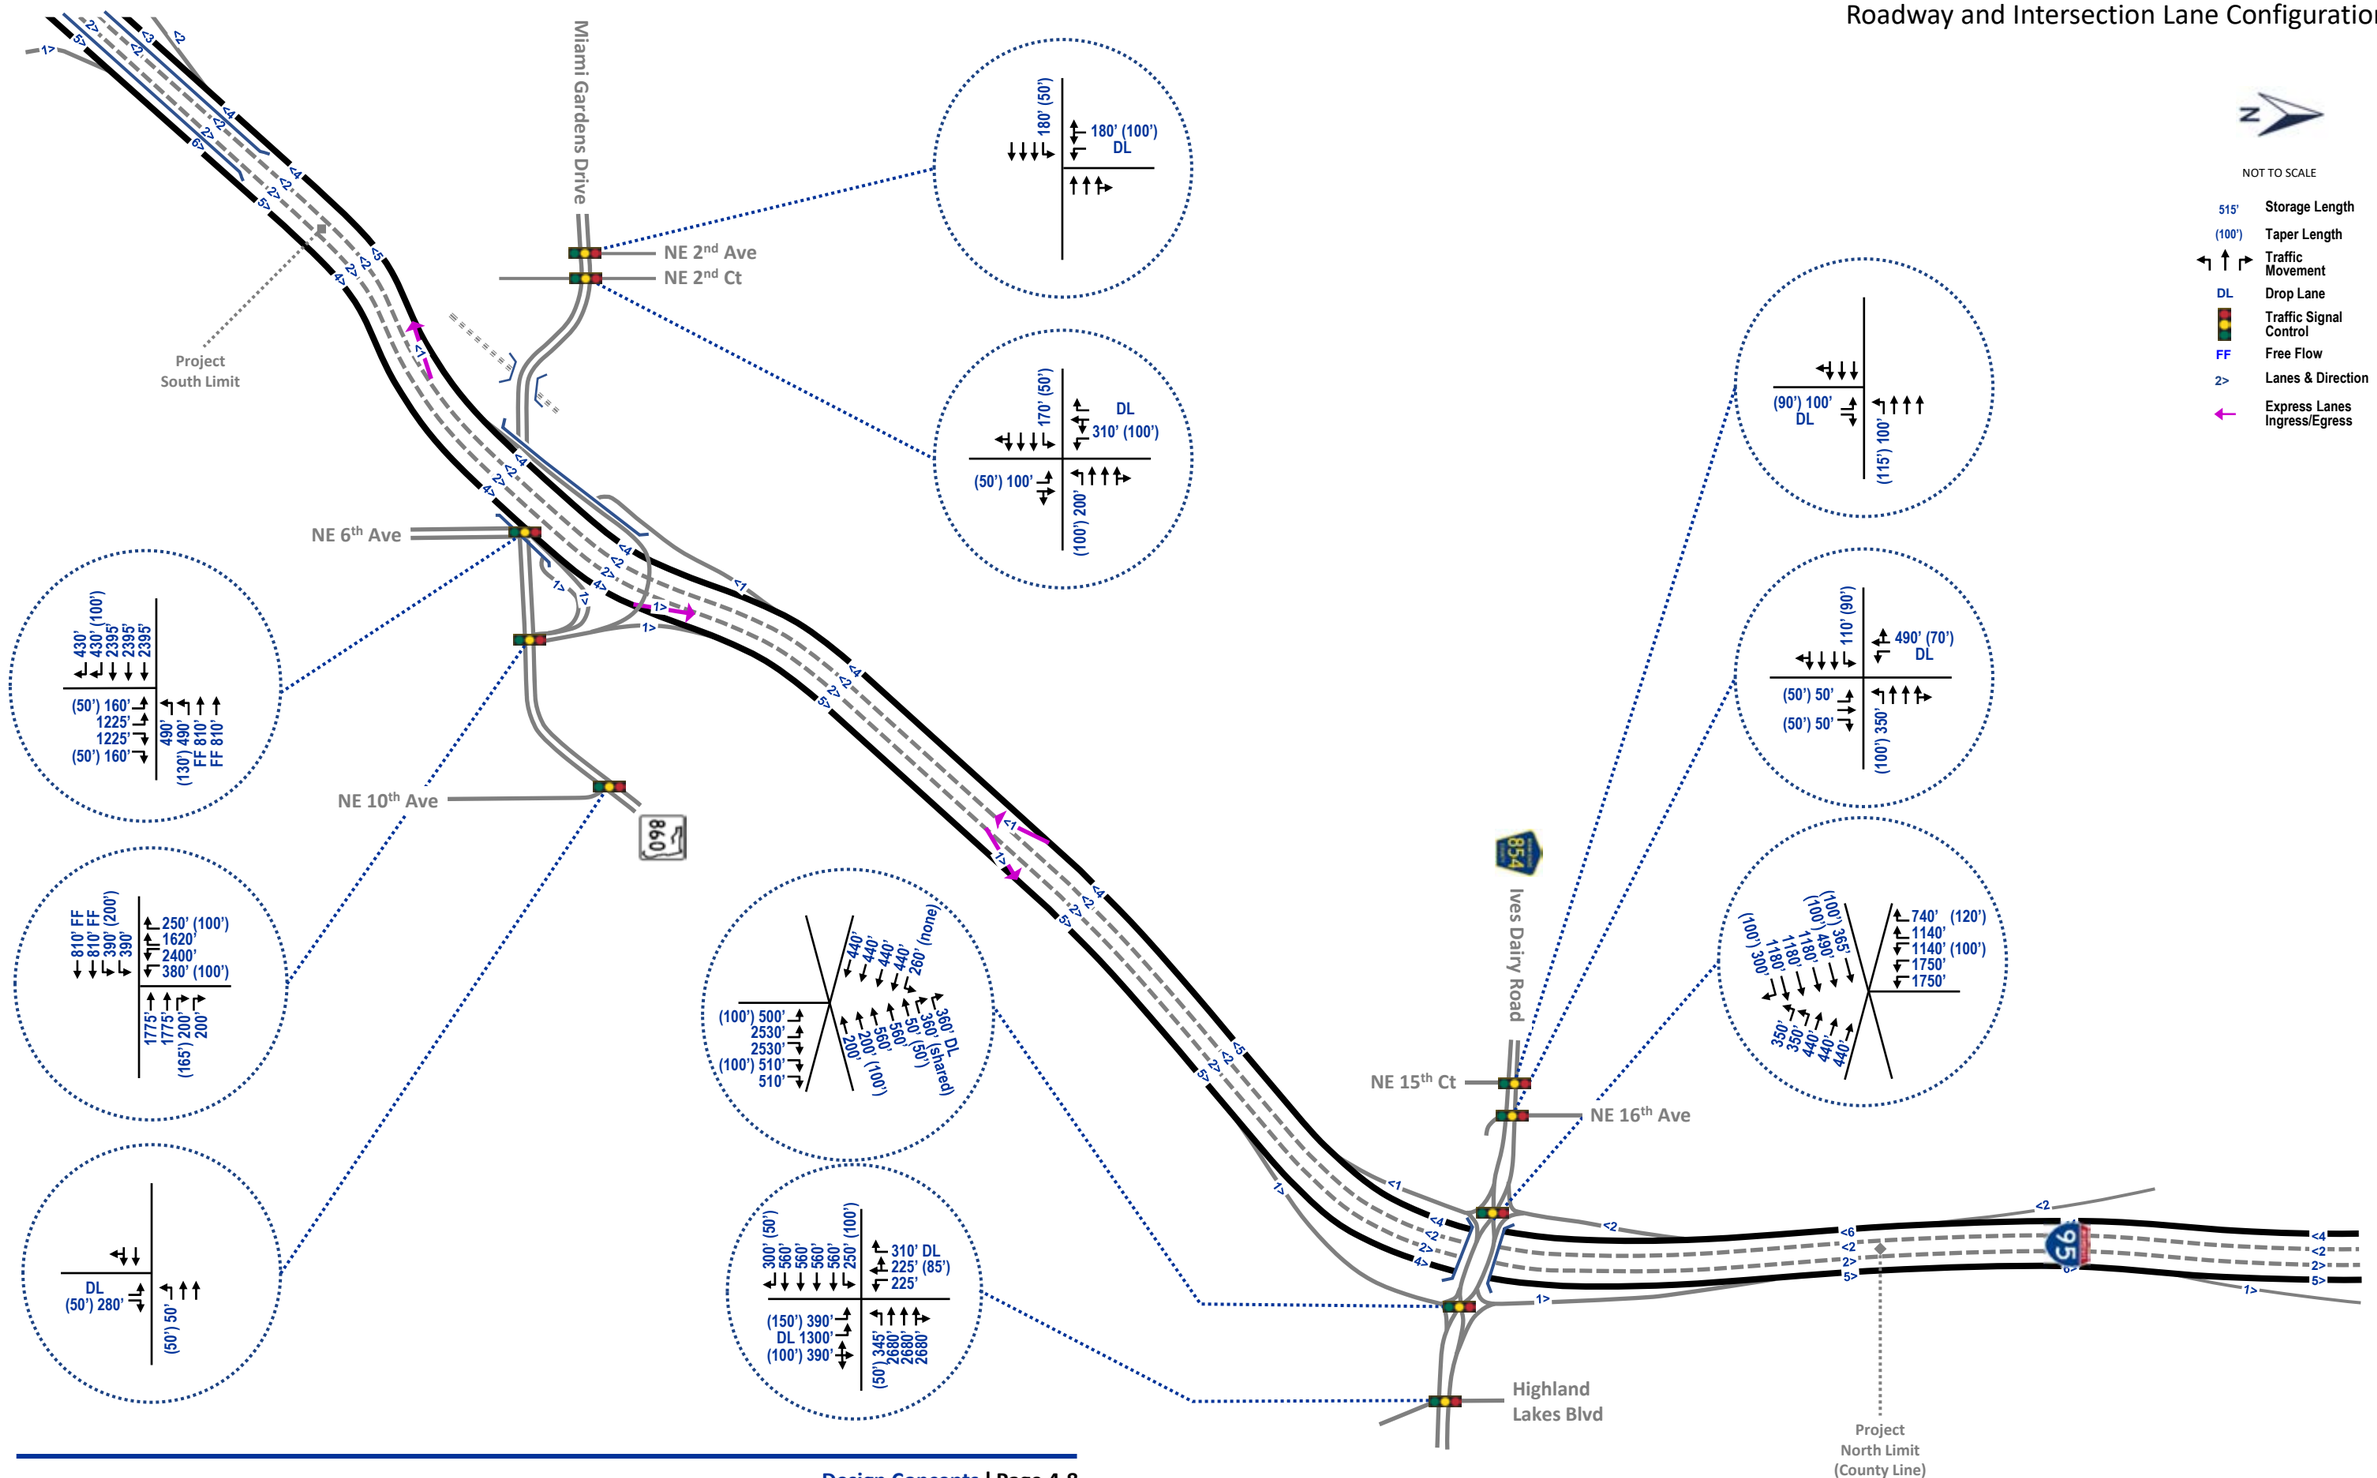

Figure 4.5:
Build Alternative 1 Opening Year 2030
Traffic Volumes

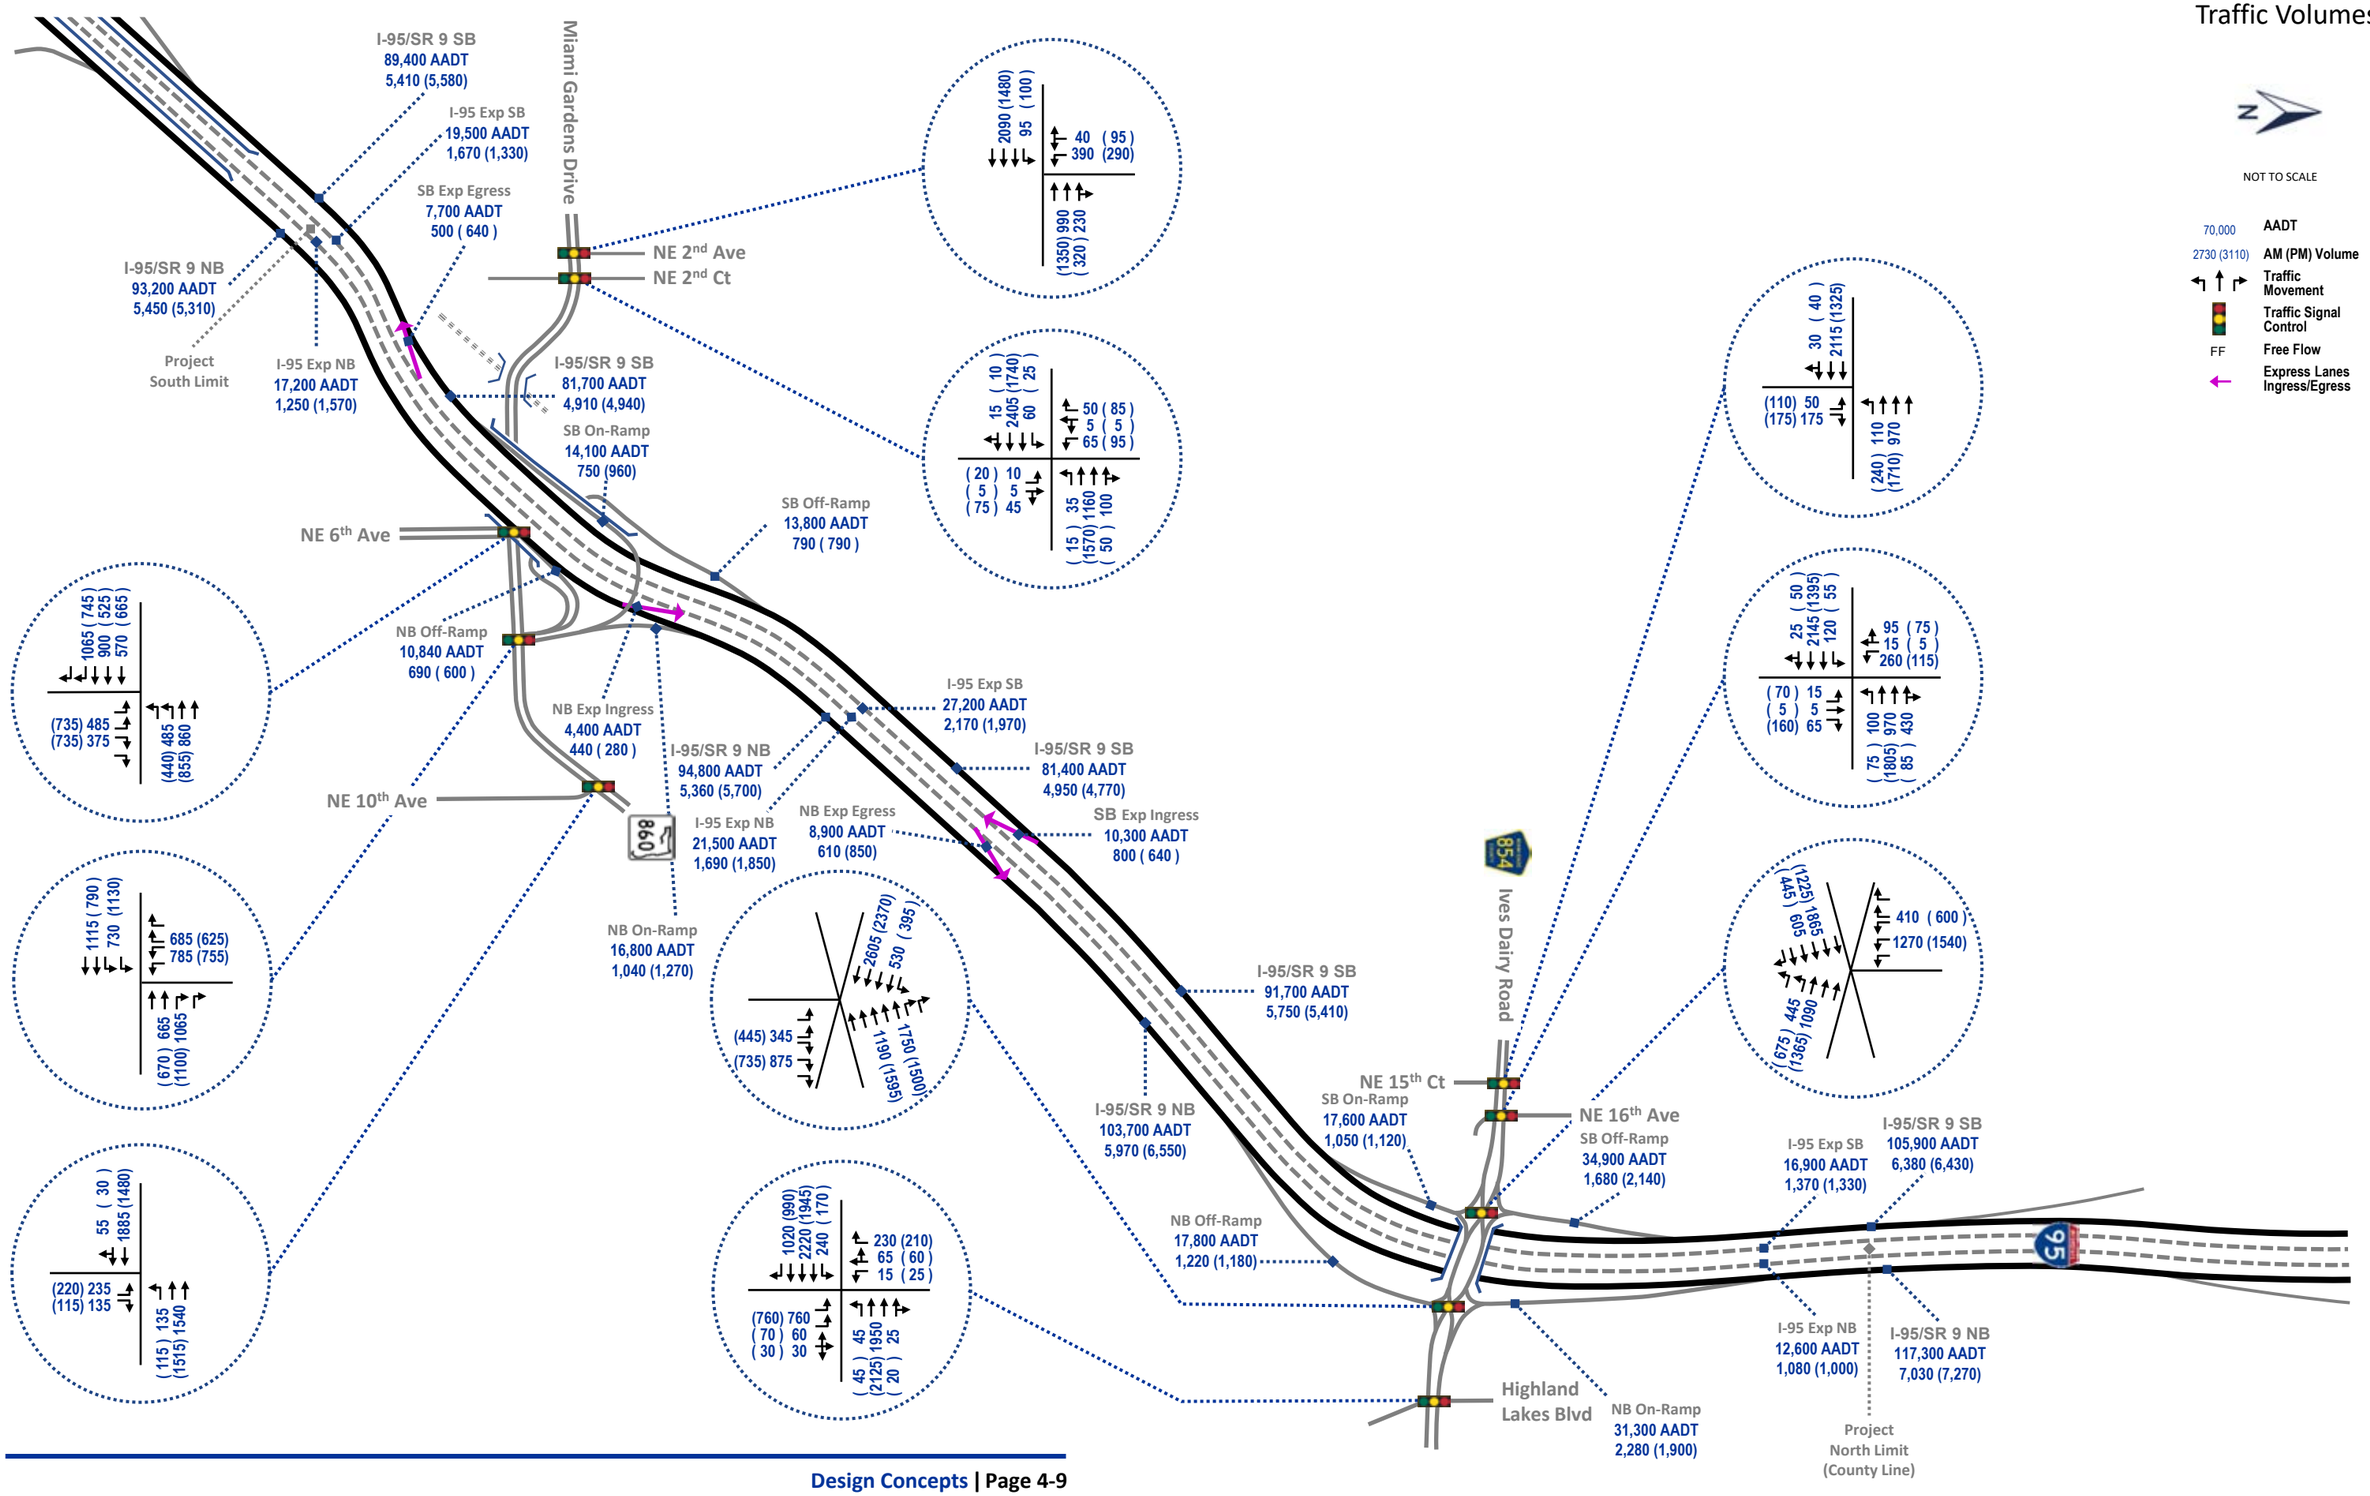

Figure 4.6:
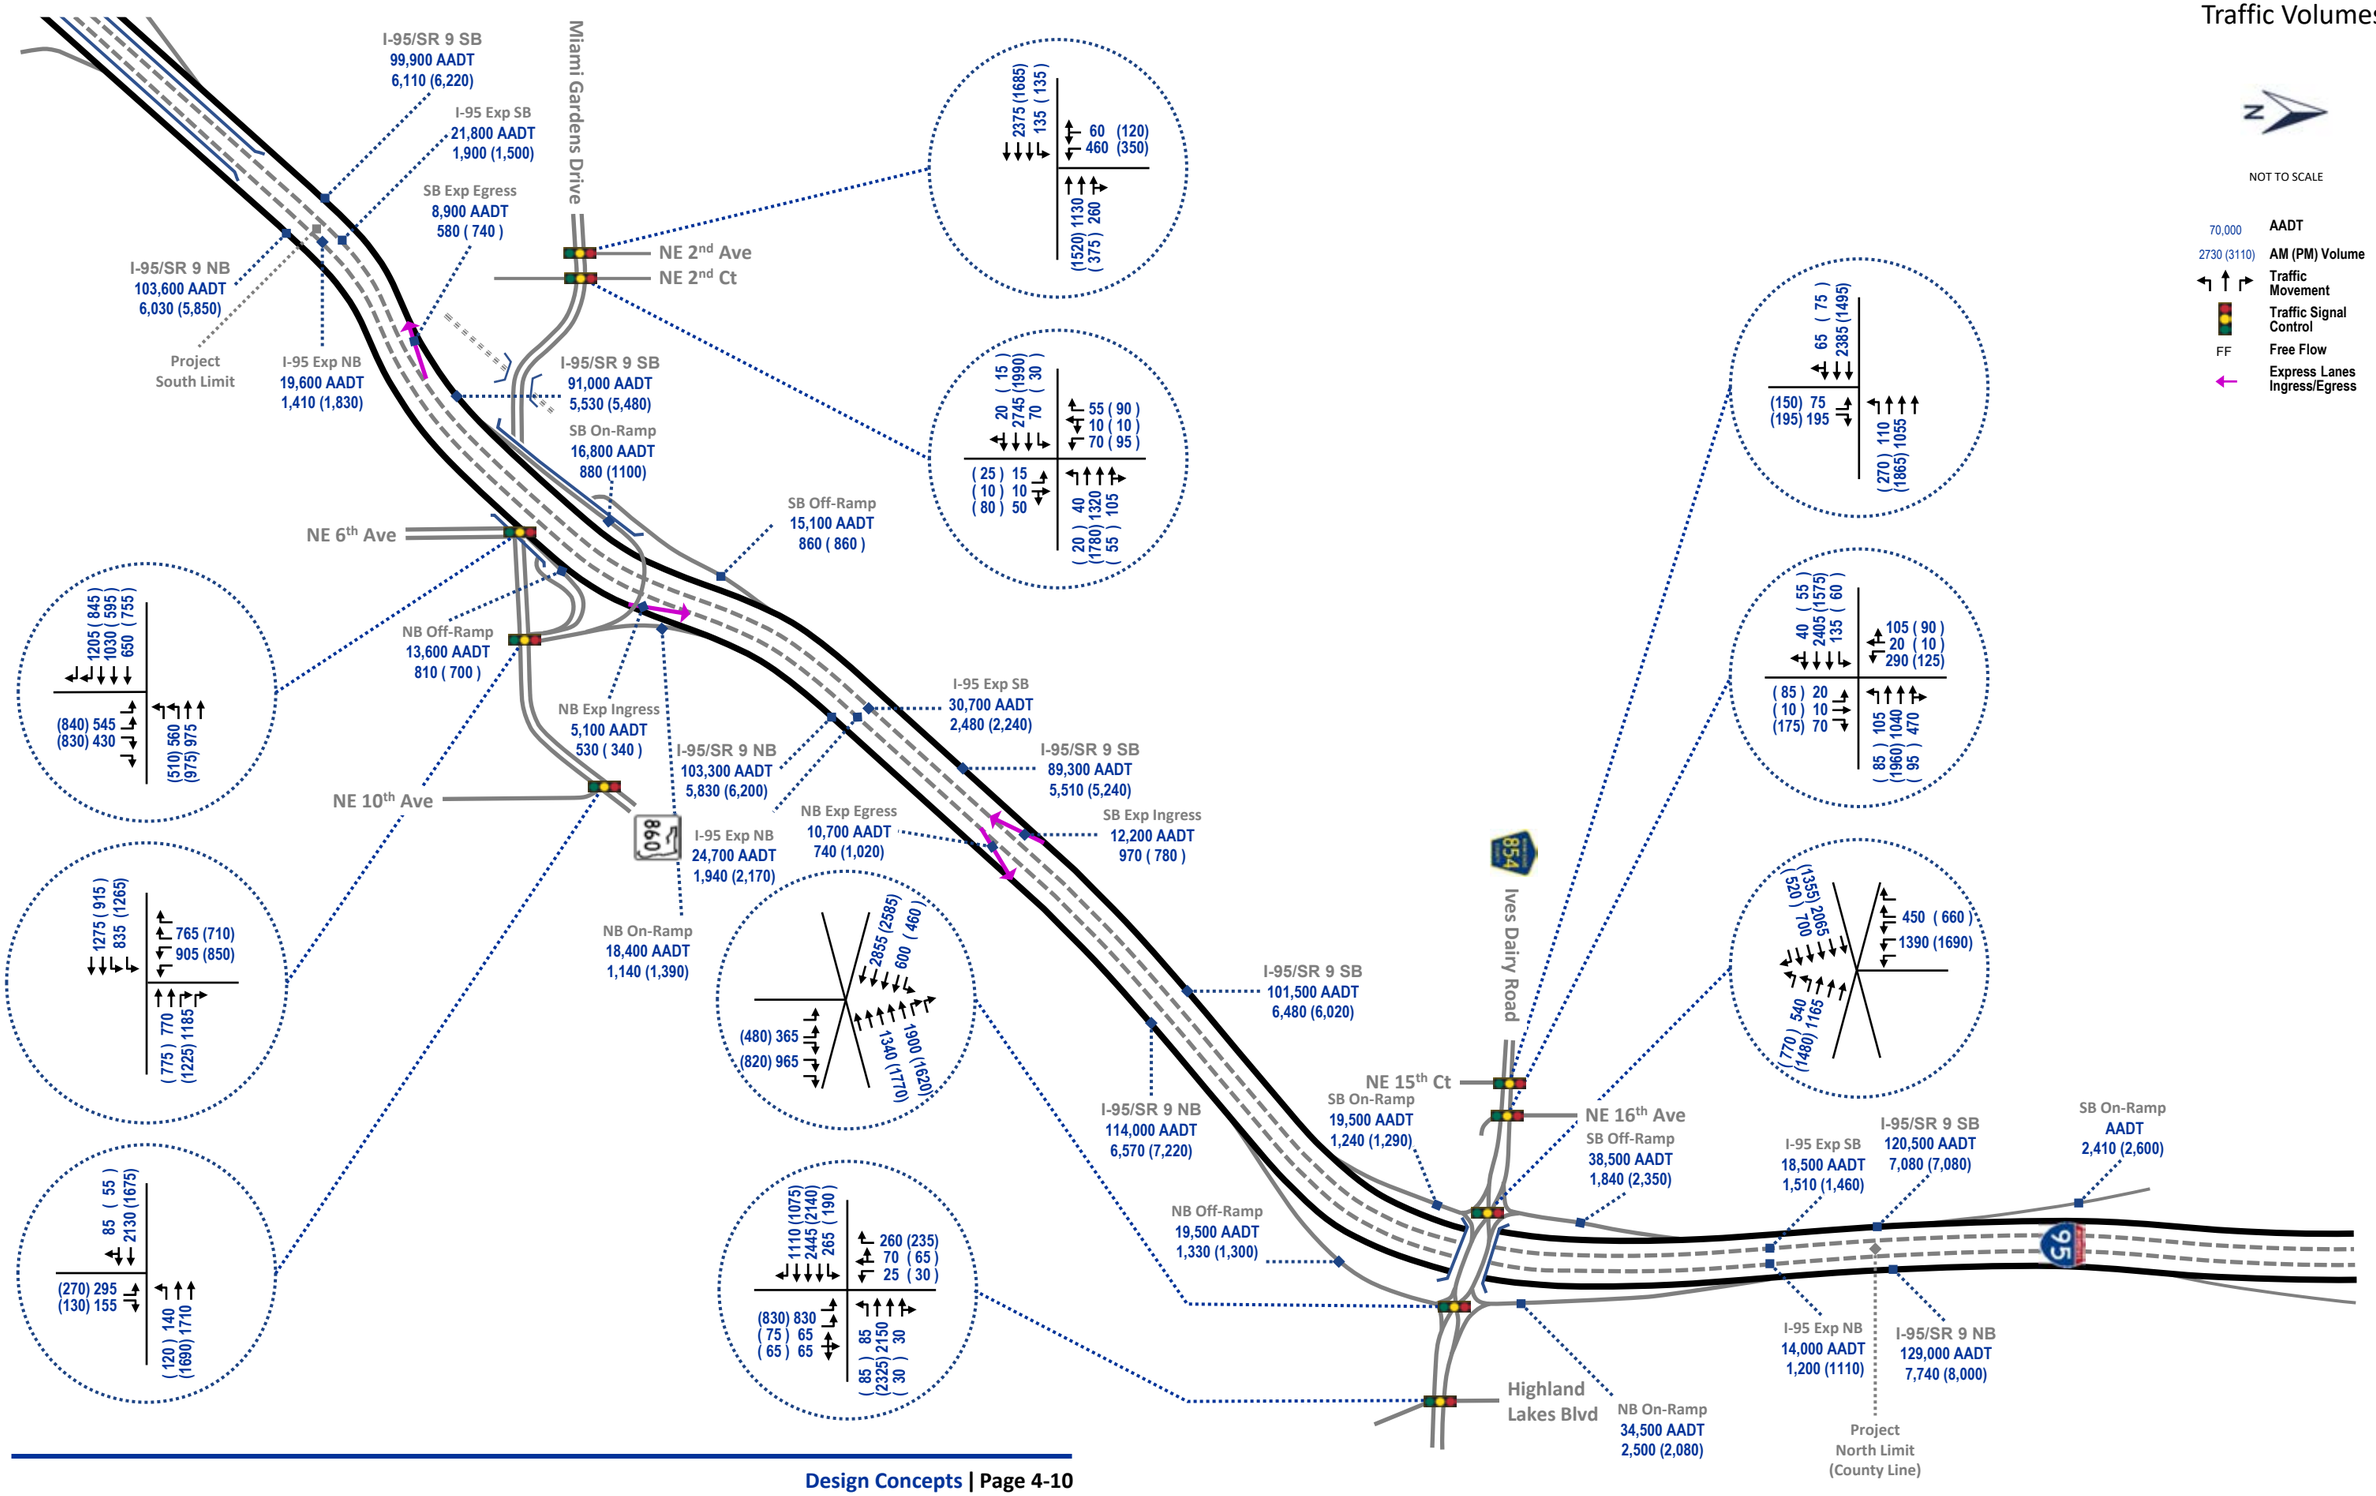
Build Alternative 1 Design Year 2050
Traffic Volumes



4.5 Build Alternative 2 – Transportation Network & Traffic Volume Projections

Alternative 2 is based on the *FDOT District 4 SR 9/I-95 (SR 9) Planning Study from south of the Golden Glades Interchange to north of the SR 9/I-95 and I-595 Interchange (FM: 436903-1-22-02) in Broward County*. From this Planning Study, two alternatives (Alternative 1 and Alternative 3) were recommended to be considered in this PD&E Study which was further evaluated as Build Alternative 2 for this PD&E Study. **Figure 4.7** presents the Build Alternative 2 Lane Configuration. Build Alternative 2 Traffic volume projections are presented in **Figures 4.8** and **4.9** for opening and design years, respectively.

SR 9/I-95 Mainline and Express Lanes - Similar to Alternative 1, Alternative 2 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. A significant difference between Alternative 1 and Alternative 2 is that a series of braided movements are proposed for the express lanes access points, and two auxiliary lanes are provided in each direction for Alternative 2, rather than one auxiliary lane in each direction. In conjunction with the braided ramps, the second auxiliary lane eliminates the need to weave across the general-purpose lanes to access the express lanes.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location (similar to Alternative 1), but with grade-separated on-ramps. This configuration allows for traffic to free flow onto the mainline, as opposed to Alternative 1, which provides at-grade traffic signal control. The NB Off-Ramp is also expanded to two lanes from one lane.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the existing diamond interchange to a Single Point Urban Interchange (SPUI). Similar to Alternative 1, an additional eastbound lane is provided along the arterial. Also, the WB to NB On-Ramp is expanded to two lanes.

4.6 Build Alternative 3 – Transportation Network & Traffic Volume Projections

SR 9/I-95 Mainline and Express Lanes - Alternative 3 was developed based on feedback from the Public Alternatives Workshop. Alternative 3 is based on a combination of Alternative 1 and Alternative 2, with refinements. Alternative 3 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. Same as in Alternative 2, the braided ramps and additional auxiliary lanes eliminate the need to weave across the general-purpose lanes to access the express lanes. **Figure 4.10** presents the Build Alternative 3 Lane Configuration. Build Alternative 3 Traffic volume projections are presented in **Figures 4.11** and **4.12** for opening and design years, respectively.

SR 860/Miami Gardens Drive - Same as in Alternative 2, the proposed improvements at SR 860/Miami Gardens Drive consist of a grade-separated on-ramp. This configuration will allow for traffic to free flow onto the mainline. In addition, the northbound and southbound off ramp will be extended and connected to the west of SR 9/I-95 in advance of the modified single ramp terminal to the east of SR 9/I-95. The purpose for this new configuration is to accommodate the weaving friction between these two movements along a longer segment and to increase storage length to avoid spill back into SR 9/I-95 mainline.

CR 854/Ives Dairy Road - Same as in Alternative 1, improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound through lane, an additional westbound to northbound on-ramp lane, and new signal timing are provided to help reduce the congestion of traffic in the area. Also, the WB to NB On-Ramp is expanded to two lanes.

5 OPERATIONAL ANALYSIS

Similar to existing conditions, a four-hour analysis period was selected to ensure that traffic operations were accurately modeled. The four-hour analysis period provided adequate time for congestion build-up and dissipation. A 30-minute seeding period was coded. The second hour represented the peak hour. Therefore, the second hour results are summarized in the following section. The results for the additional three hours of analysis are provided in the appendix.

The start of the delay segment is a network parameter, and it cannot be set for each approach of a node. In order to be conservative and capture the upstream delay related to each movement, the start of the delay segment in the node evaluation configuration is coded as half a mile before the node. Therefore, the queue lengths for some free-flow right-turn movements are reported as 0 feet, given that these movements do not need to stop, and no queue is accumulated in the simulation. However, the delay associated with the free right-turn movement is measured starting from half a mile ahead of the node, where right-turn traffic mixes with through and left-turn traffic. The reported delays indicate that this right-turn traffic will experience delays prior to arriving at the intersection. Similarly, queue measuring starts upstream the node when speeds are lower than 3.1 mph and stop when the speed goes back to 6.2 mph. Queue measuring also considers adjacent lanes. Therefore, some free-flow left- and right-turn movements may report a queue length, and no delay is accumulated in the simulation. Future Vissim freeway, express lanes, ramp terminal intersections, and complex weaving traffic operational analysis is provided in **Appendix L**. Synchro summary worksheets are presented in **Appendix M.**

Note that for the existing conditions, the lane change distances coded in the Vissim model were designed to replicate current driving behaviors and meet calibration criteria for spot speeds and traffic volumes. It should be noted that lane change distances for future conditions may differ from existing conditions due to changes in congestion or geometry. For example, a lane drop from the entry point south of Miami Gardens Drive on northbound I-95 has a lane change distance of 1,320 feet per lane in the existing AM model. For Build Alternative 3, the traffic conditions and lane geometry on the I-95 northbound mainline, south of Miami Gardens Drive, differ significantly from the existing conditions. The lane change distance was increased to 4,500 feet per lane to reflect the anticipated future signage informing drivers of the lane condition for the exit movement and the different proposed entrance from the GGI Ultimate configuration.

In addition, the lane change distance at the southbound express lane egress point, south of Miami Gardens Drive, is coded as 1,800 feet in the existing AM model. For Build Alternative 3, significant lane geometry changes are proposed, including a flyover to provide an egress point from the southbound express lanes to the general-purpose lanes. In the Vissim model, the lane change distance has been increased to 5,700 feet per lane. It is reasonable to assume that a portion of drivers will begin positioning themselves into the correct lanes at least one mile ahead of the decision point, prior to the GGI interchange along the express lanes, aided by prevalent GPS devices.

5.1 No-Build Alternative

The primary need for this project is to address the deficient operational capacity and relieve existing/future congestion along the SR 9/I-95 corridor and its interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, which in turn will improve safety and reduce travel time. This need is evidenced by the operational analysis results of the No-Build Alternative.

5.1.1 Vissim Freeway, Express Lanes, and Ramp Terminal Intersection Analysis

The freeway analysis results indicate that most of the general-purpose lane freeway segments in the study area will experience moderate or heavy congestion during one or both peak hour periods as defined by one of the MOEs. The available capacity will not be able to serve 90% or more of the projected demand for any of the segments in the southbound direction during either the AM or PM peak hour periods. Similarly, all southbound Express Lanes segments will not be able to serve 90% or more of the projected demand during the AM Peak Hour period. **Figures 5.1** and **5.2** present the freeway analysis results for the No-Build Alternative opening and design years, respectively.

The intersection analysis results indicate that all the intersections will operate at LOS E or F during the AM and PM Peak Hour periods. The analysis also indicates that the available capacity of the intersections will only be able to process up to 90% of the projected demand (i.e., less than 90% for each intersection). In addition, there are several movements that operate at LOS E and F, and queuing exceeds available storage. Therefore, all intersections are expected to operate under moderate to heavily congested conditions. **Tables 5.1** and **5.2** present the intersection Opening Year 2030 analysis results for the No-Build Alternative during the AM and PM peak hours, respectively. The intersection Design Year 2050 analysis results for the No-Build Alternative during the AM and PM peak hours are shown in **Tables 5.3** and **5.4**, respectively.

5.1.2 Vissim Freeway Complex Weaving Analysis

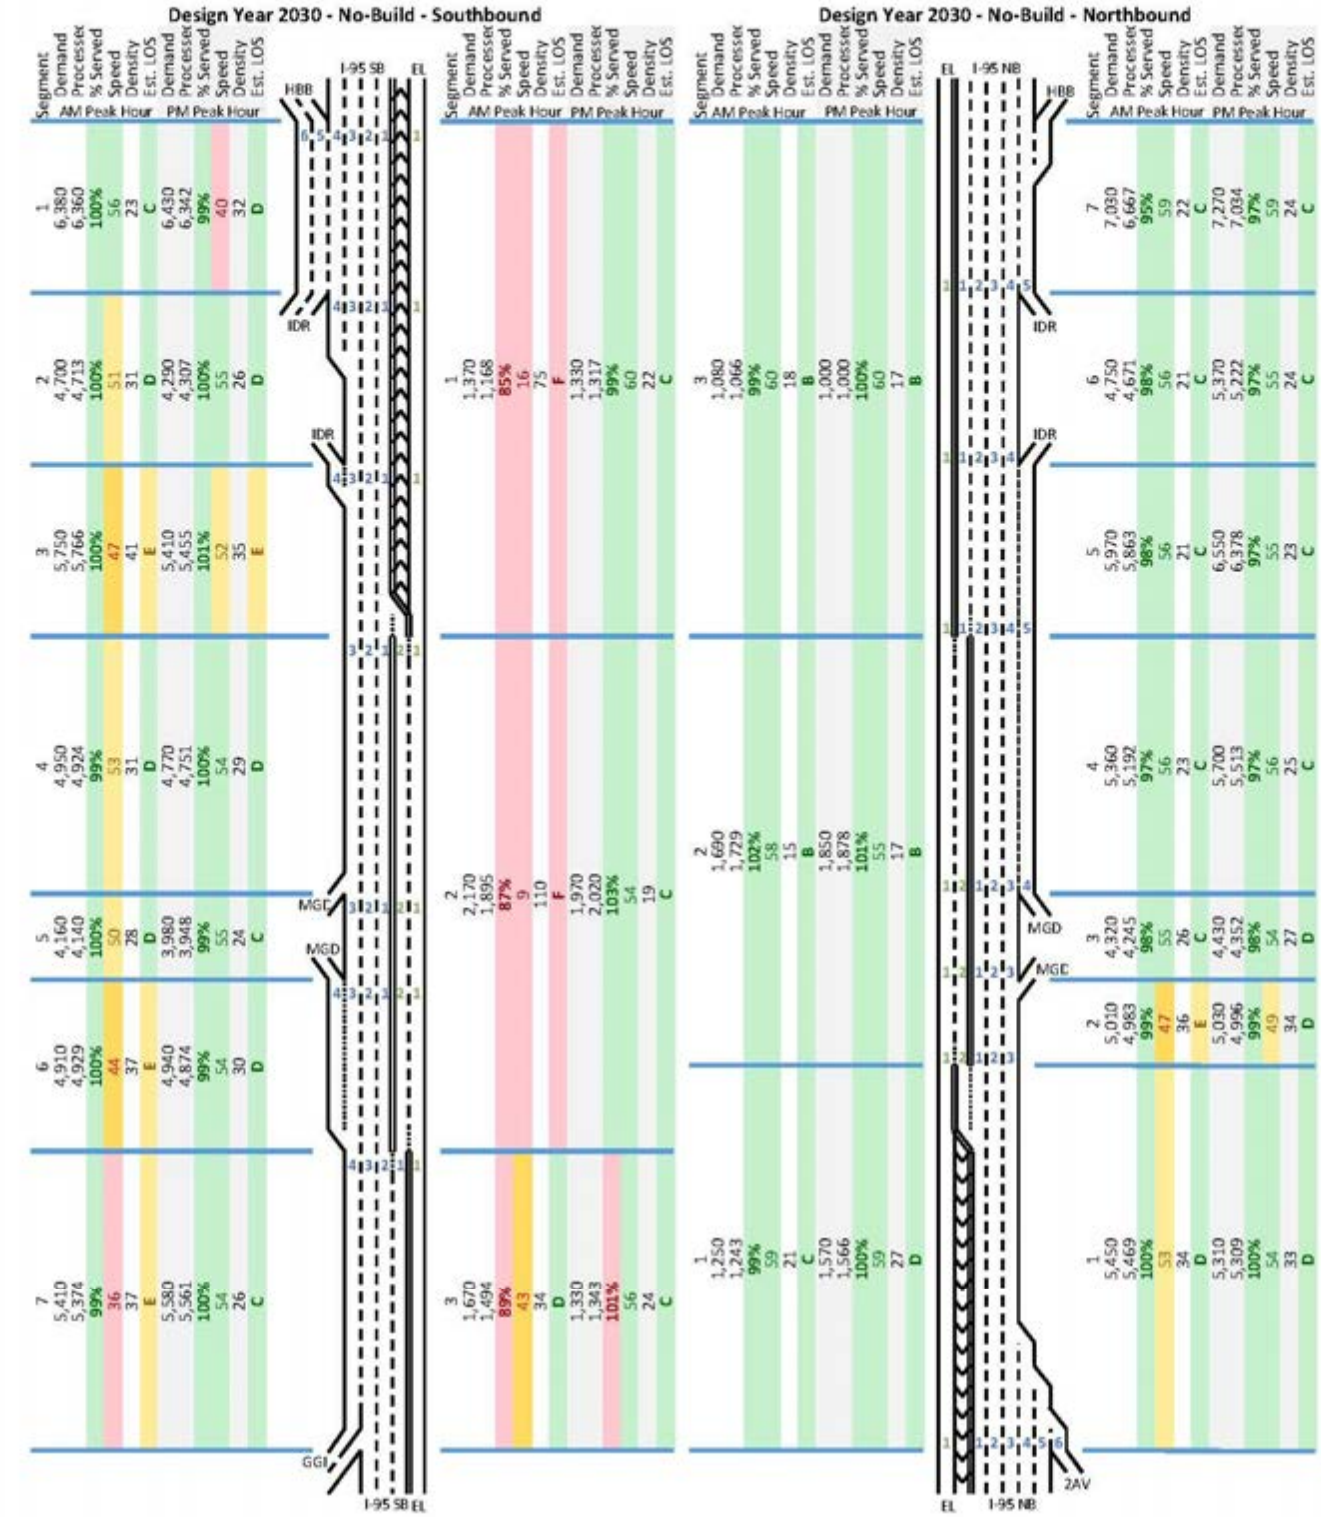
The Vissim freeway complex weaving analysis is based on Section 8.8 of the *2021 FDOT Traffic Analysis Handbook*. The analysis considers V/C Ratio, Speed Differential and Vehicles Disappearing. The reduction in the capacity to 1,800 vehicles per hour was used to determine the volume to capacity (V/C) ratio for each complex weave segment within the project. Similar to Existing Conditions, the No-Build Configuration shows one complex weave segment on each direction, with the critical segments at Segment 1 and Segment 5 for the SB and NB directions, respectively.

The V/C Ratio analysis shows adequate operations with v/c ratios of less than 1.00 for the critical segments. However, the Speed Differential analysis indicates inadequate operations with speed differences higher than 10 mph between weaving and non-weaving movements. Similarly, the Vehicle Disappearing analysis also shows volume differences to be more than ten (10) vph, which indicates congestion.

5.1.3 Adjacent Intersection Synchro Operational Analysis

The AOI included the adjacent signalized intersections within half-a-mile of the interchanges (i.e., a total of ten (10) intersections). Adjacent intersections were analyzed using Synchro. Based on the results of Synchro analysis, only ramp terminal intersections and the intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard were included in the Vissim microsimulation analysis (i.e., a total of five (5) intersections).

The Synchro analysis results for the remaining five (5) adjacent intersections is presented in **Tables 5.29** through **5.32** for Opening Year 2030, Design Year 2050, and the AM and PM peak hours, respectively. A couple of noticeable specific movements have a deterioration of LOS from the No-Build Alternative to the Build Alternative 3. They include the following: 1) SWL at SR 860/Miami Gardens Drive and NE 10th Avenue intersection, which degrades from LOS E to LOS F during the Design Year 2050 AM peak hour period; and 2) EBT/EBR at CR 854/Ives Dairy Road and NE 16th Avenue, which degrades from LOS B to LOS E and LOS A to LOS E during the Design Year 2050 AM and PM peak hour periods, respectively. These deteriorations are the result of signal timing optimization. In the first case, the overall intersection level of service improves from LOS E to LOS D. For the second case, the optimization improves the most critical movement v/c ratio improving it from 1.69 to 1.01 during the AM peak hour period and improving the overall delay during the PM peak hour period. Furthermore, the Synchro analysis indicates that these five (5) adjacent intersections are not impacted by or impact the operations of the interchanges.



Legend

Volume % Served	Posted Speed 55 mph	Estimated LOS
> 90%	>= 53	LOS A - D
= 90%	< 53 - 48	LOS E
< 90%	< 48 - 43	LOS F
	< 43

m: Volume for 95th percentile queue is metered by upstream signal.

5.2 Build Alternative 1

Build Alternative 1 is based on the *FDOT District 6 SR 9/I-95 Corridor Planning Study (FM: 414964-6-22-01)*. This alternative provides a homogeneous 4-lane SR 9/I-95 Mainline and 2-lane Express Lanes in the southbound and northbound direction, consolidates the ramp terminals to a single at-grade ramp terminal intersection on the east side of SR 860/Miami Gardens Drive, and modifies the CR 854/Ives Dairy Road interchange to a DDI configuration.

5.2.1 Vissim Freeway, Express Lanes, and Ramp Terminal Intersection Analysis

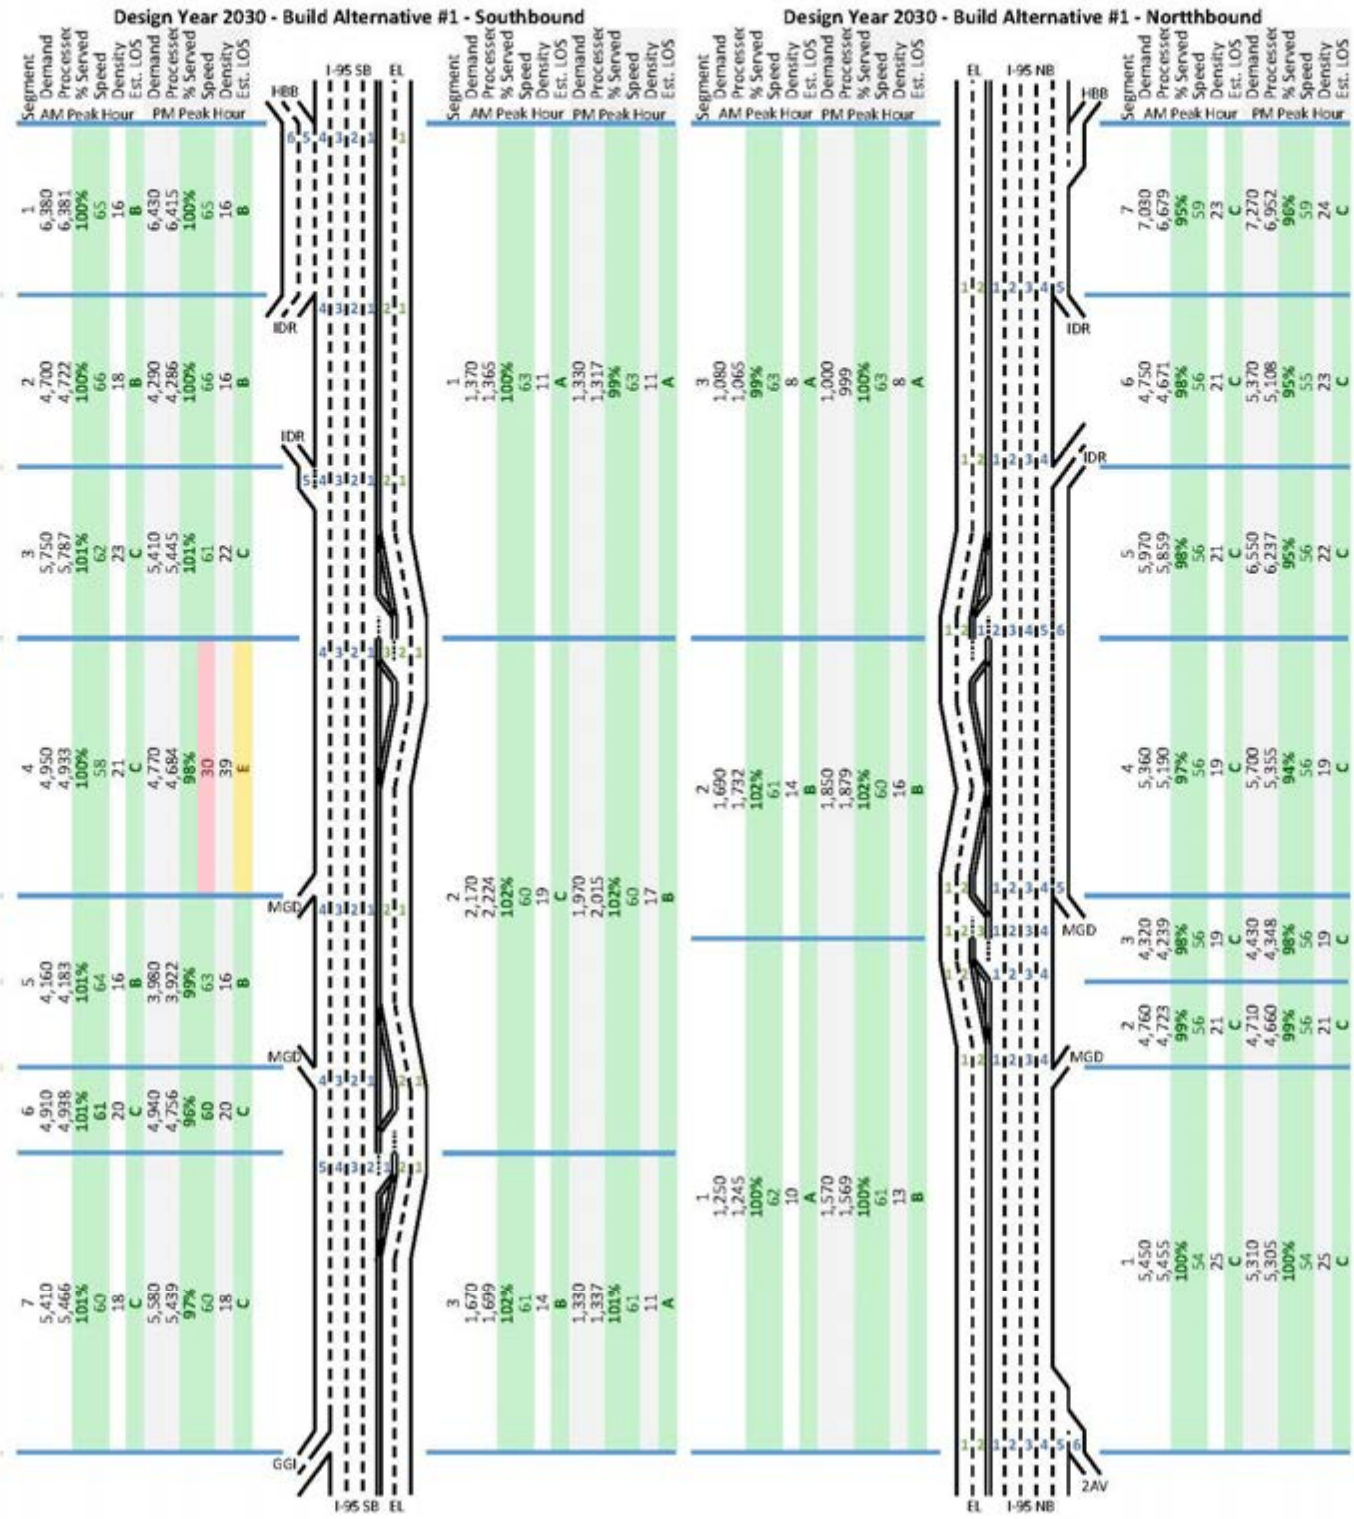
The freeway analysis results indicate that freeway operations do improve due to the additional capacity. However, most segments in the study area will still not be able to serve 90% or more of the projected demand during the PM peak hour mainly due to significant weaving to access to/from the express lanes. Express Lanes will have adequate operations during the AM and PM Peak Hour periods due to the additional lane capacity. **Figures 5.3** and **5.4** present the freeway analysis results for the Build Alternative 1 opening and design years, respectively.

The ramp terminal intersection analysis results indicate that the operations at SR 860/Miami Gardens Drive will deteriorate during both the AM and PM Peak Hour periods compared to the No-Build Alternative. These results are mainly due to the reduction of capacity by consolidating the ramp terminals to a single at-grade ramp terminal intersection. The operations at the CR 854/Ives Dairy Road interchange will improve due to its reconfiguration into DDI configuration; however, additional cycle modifications are required to achieve better LOS results. The intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard will still operate at LOS F. Improvements at this intersection are restricted due to right of way limitations, which only allows for one additional through lane in one direction along CR 854/Ives Dairy Road and no improvements along Highland Lakes Boulevard. Because of this right of way limitations, only a through lane on the eastbound was added along CR 854/Ives Dairy Road to reduce impact to the interchange operations. **Tables 5.9** through **5.12** present the ramp terminal intersection Opening Year 2030 and Design Year 2050 analysis results for the Build Alternative 1 during the AM and PM peak hours, respectively.

5.2.2 Vissim Freeway Complex Weaving Analysis

The Vissim freeway complex weaving analysis is based on Section 8.8 of the *2021 FDOT Traffic Analysis Handbook*. The analysis considers V/C Ratio, Speed Differential and Vehicles Disappearing. The reduction in the capacity to 1,800 vehicles per hour was used to determine the volume to capacity (V/C) ratio for each complex weave segment within the project. The Existing Configuration shows one complex weave segment on each direction, with the critical segments at Segment 1 and Segment 5 for the SB and NB directions, respectively.

The V/C Ratio analysis shows adequate operations with v/c ratios of less than 1.00 for the critical segments. However, the Speed Differential analysis indicates inadequate operations with speed differences higher than 10 mph between weaving and nonweaving movements. Similarly, the Vehicle Disappearing analysis also shows volume differences to be more than ten (10) vph, which indicates congestion.



Legend

Volume % Served	Posted Speed 55 mph	Estimated LOS
> 90%	>= 53	LOS A - D
= 90%	< 53 - 48	LOS E
< 90%	< 48 - 43	LOS F
	< 43

5.2.3 Adjacent Intersection Synchro Operational Analysis

The AOI included the adjacent signalized intersections within half-a-mile of the interchanges (i.e., a total of ten (10) intersections). Adjacent intersections were analyzed using Synchro. Based on the results of Synchro analysis, only ramp terminal intersections and the intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard were included in the Vissim microsimulation analysis (i.e., a total of five (5) intersections). The Synchro analysis results for the remaining five (5) adjacent intersections is presented in **Tables 5.13** through **5.16** for the AM and PM peak hours, respectively. The Synchro analysis indicates that these five (5) adjacent intersections are not impacted by or impact the operations of the interchanges. Therefore, no improvements are recommended to the adjacent intersections.

#: 95th percentile volume exceeds capacity; queue may be longer.
m: Volume for 95th percentile queue is metered by upstream signal.

5.3 Build Alternative 2

Alternative 2 is based on the *FDOT District 4 SR 9/I-95 Planning Study from south of the Golden Glades Interchange to north of the SR 9/I-95 and I-595 Interchange (FM: 436903-1-22-02) in Broward County*. This alternative adds braided ramps to and from Express Lanes in the southbound and northbound direction, grade-separation at the consolidated single ramp terminal intersection on the east side of SR 860/Miami Gardens Drive, and the CR 854/Ives Dairy Road interchange is modified to a SPUI configuration.

5.3.1 Vissim Freeway, Express Lanes, and Ramp Terminal Intersection Analysis

The freeway analysis results indicate that freeway segments in the study area will not be able to serve 90% or more of the projected demand for most segments in the southbound and northbound directions at least during one of the AM and PM peak hour periods. The analysis also indicates that segments 2 and 3 on the southbound direction of the Express Lanes will not serve 90% or more of the demand during the AM peak period. This is due to a grid-lock condition created at the SR 860/Miami Gardens Drive interchange due to a short storage and weaving area for the SR 9/I-95 northbound and southbound off-ramps. This condition is further impacted by the merge area from SR 9/I-95 off-ramp to SR 860/Miami Gardens Drive eastbound. **Figures 5.5** and **5.6** present the freeway analysis results for the Build Alternative 2 opening and design years, respectively.

The intersection analysis results indicate that operations at the intersection SR 860/Miami Gardens Drive and SR 9/I-95 Ramps will deteriorate and operate at LOS F during both, the AM and PM Peak Hour periods. This condition is mainly due to excess weaving between the ramp terminal and the merge point of the northbound and southbound off-ramp upstream of the intersection. The intersection analysis also indicates that the SPUI configuration provides lower capacity than the DDI configuration at the CR 854/Ives Dairy Road interchange. The intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard will still operate at LOS F. Similar to Build Alternative 1, improvements at this intersection are restricted due to right of way limitations, which only allows for one additional through lane in one direction along CR 854/Ives Dairy Road and no improvements along Highland Lakes Boulevard. Because of this right of way limitations, only a through lane on the eastbound was added along CR 854/Ives Dairy Road to reduce impact to the interchange operations. **Tables 5.17** through **5.20** present the intersection Opening Year 2030 and Design Year 2025 analysis results for the Build Alternative 2 during the AM and PM peak hours, respectively.

5.3.2 Vissim Freeway Complex Weaving Analysis

The Vissim freeway complex weaving analysis is based on Section 8.8 of the *2021 FDOT Traffic Analysis Handbook*. The analysis considers V/C Ratio, Speed Differential and Vehicles Disappearing. The reduction in the capacity to 1,800 vehicles per hour was used to determine the volume to capacity (V/C) ratio for each complex weave segment within the project. The Build Alternative 2 configuration shows one complex weave segment on the southbound direction, with the critical segments at Segment 1. For Build Alternative 2, the previous complex weave on the northbound direction was eliminated.

The V/C Ratio analysis shows adequate operations with v/c ratios of less than 1.00 for the critical segments. However, the Speed Differential analysis indicates inadequate operations with speed differences higher than 10 mph between weaving and nonweaving movements. Similarly, the Vehicle Disappearing analysis also shows volume differences to be more than ten (10) vph, which indicates congestion.

5.3.3 Adjacent Intersection Synchro Operational Analysis

The AOI included the adjacent signalized intersections within half-a-mile of the interchanges (i.e., a total of ten (10) intersections). Adjacent intersections were analyzed using Synchro. Based on the results of Synchro analysis, only ramp terminal intersections and the intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard were included in the Vissim microsimulation analysis (i.e., a total of five (5) intersections). The Synchro analysis results for the remaining five (5) adjacent intersections is presented in **Tables 5.21** through **5.24** for the AM and PM peak hours, respectively. The Synchro analysis indicates that these five (5) adjacent intersections are not impacted by or impact the operations of the interchanges. Therefore, similar to Build Alternative 1, no improvements are recommended to the adjacent intersections.

5.4 Build Alternative 3

Alternative 3 is based on a combination of Alternative 1 and Alternative 2, with refinements. Refinements include: braided ramps on the southbound direction to eliminate weaving between Pembroke Road on-ramp and CR 854/Ives Dairy Road off-ramp movements, extension of the northbound and southbound off ramps to the west of SR 9/I-95 in advance of the modified single ramp terminal to the east of SR 9/I-95 to eliminate the weaving friction between these off-ramp movements at SR 860/Miami Gardens Drive interchange, and new cycle length timing along CR 854/Ives Dairy Road to optimize operations under the DDI configuration.

5.4.1 Vissim Freeway, Express Lanes, and Ramp Terminal Intersection Analysis

The freeway analysis results indicate that all the freeway segments in the study area will be able to serve 90% or more of the projected demand for all the segments in the southbound and northbound directions during the AM and PM peak hour periods. The analysis also indicates that both directions of the Express Lanes and the northbound direction of the General Use Lanes will operate uncongested during both peak hour periods. In addition, all southbound General Use Lane segments will be improved to indicate lightly congested operations. A review was also conducted for the two weaving areas within the On-Ramps from CR 854/Ives Dairy Road, which also provides slip ramp ingress to the express lanes. The review indicates that these two segments maintain operating speeds of approximately 38 mph similar to the No-Build Alternative and Build Alternatives 1 and 2. **Figures 5.7** and **5.8** present the freeway analysis results for the Build Alternative 3 opening and design years, respectively.

The intersection analysis results indicate that the SR 860/Miami Gardens Drive interchange intersections will operate at LOS D or better during both, the AM and PM Peak Hour periods, due to is reconfiguration into grade separation. A review of the results for SR 860/Miami Gardens Drive indicates that a couple of movements do not achieve 90% or greater volume served. This is not the result of the analysis, but rather sending additional vehicles into NE 6th Avenue. The correct distribution will move signal-controlled left-turn volumes (WBL) to free-flowing through traffic (WBT FF); as a result, operations would improve slightly at this interchange. The operations at the CR 854/Ives Dairy Road interchange will also improve to LOS D or better during both, the AM and PM Peak Hour periods, due to its reconfiguration into DDI configuration with cycle length modifications. The intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard will still operate at LOS F. Similar to Build Alternatives 1 and 2, improvements at this intersection are restricted due to right of way limitations, which only allows for one additional through lane in one direction along CR 854/Ives Dairy Road and no improvements along Highland Lakes Boulevard. Because of this right of way limitations, only a through lane on the eastbound was added along CR 854/Ives Dairy Road to reduce impact to the interchange operations. **Tables 5.25** through **5.28** present the intersection Opening Year 2030 analysis and Design Year 2050 results for the Build Alternative 3 during the AM and PM peak hours, respectively.

5.4.2 Vissim Freeway Complex Weaving Analysis

All complex weave segments were removed within the study area in Build Alternative 3. This was achieved by the implementation of direct ingress/egress (braided) ramps to and from the express lanes. Therefore, Vissim freeway complex weaving analysis is not required for Build Alternative 3.

5.4.3 Adjacent Intersection Synchro Operational Analysis

The AOI included the adjacent signalized intersections within half-a-mile of the interchanges (i.e., a total of ten (10) intersections). Adjacent intersections were analyzed using Synchro. Based on the results of Synchro analysis, only ramp terminal intersections and the intersection of CR 854/Ives Dairy Road and Highland Lakes Boulevard were included in the Vissim microsimulation analysis (i.e., a total of five (5) intersections). The Synchro analysis results for the remaining five (5) adjacent intersections is presented in **Tables 5.29** through **5.32** for the AM and PM peak hours, respectively. The Synchro analysis indicates that these five (5) adjacent intersections are not impacted by or impact the operations of the interchanges. Therefore, similar to Build Alternatives 1 and 2, no improvements are recommended to the adjacent intersections.

5.5 Network-wide Analysis

The network-wide analysis also indicates that Build Alternative 3 provides the highest improvements over the No-Build Alternative operations. **Tables 5.33** through **5.36** present the network-wide Opening Year 2030 performance measures for the AM and PM peak hour periods, respectively.

Table 5.33 – Opening Year 2030 AM Network-wide Performance Measures

MOE	Analysis Hour	No-Build Alternative	Build Alternative 1	Build Alternative 2	Build Alternative 3

6 SAFETY ANALYSIS

6.1 Quantitative Analysis

A quantitative safety analysis was performed for SR 9/I-95 Mainline from South of SR 860/Miami Gardens Drive to North of Broward County Line per the Highway Safety Manual (HSM) predictive crash procedures in compliance with FDOT's Safety Analysis guidelines. The safety analysis includes the interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road and their corresponding ramp terminal intersections. Adjacent intersections were not included since no geometry or AADT changes will occur at the other adjacent intersections.

A review of the HSM Methodology indicates that it has some limitations on the applicability of the Predictive Method for conducting a quantitative evaluation of future safety conditions within the study area. These limitations include:

- The procedure does not perform safety analysis for freeway segments with managed lanes. Currently, express lanes with tubular delineator buffer are present along SR 9/I-95 within the study area; and they will be maintained (including the tubular delineator buffer) for the No-Build Alternative and expanded from one to two lanes for all Build Alternatives.

- The procedure does not perform safety analysis for ramp and C-D Roads with 3 or more lanes in an urban area. Build Alternatives 2 and 3 propose 3-lane C-D segments as part of the braided ramp access to and from the express lane.

In addition to the above limitations of the Predictive Method, it was also noted that the AADTs along segments of SR 9/I-95 exceeded the applicable range of the safety performance functions. Segments with AADTs above the threshold were still used in the analysis. Given the above limitations of the HSM Predictive Methodology, caution and judgement should be exercise when comparing the actual crash rate predictions.

Crash predictions for the future No-Build and Build Alternative were computed using the FHWA Interactive Highway Safety Design Module (IHSDM), FDOT Safety for Intersection Control Evaluation (SPICE), and FHWA Interchange Configuration Safety Comparison (ICSC) tools. These software tools automate the calculations for the Safety Performance Functions (SPFs) in Part C of the HSM. The analysis required gathering various input data for SR 9/I-95 segments, ranging from geometric elements, such as alignment and cross section data, roadside and ramp access data and annual average daily traffic (AADT) data. These procedures were used for comparing the predicted crashes in the project design life between Opening Year 2030 and Design Year 2050 for the No-Build and Build alternatives. Since the Existing Conditions differ significantly from the proposed Build Alternatives, the Empirical Bayes method is not applicable for this study. Only mainline General Use lanes and ramp merge/diverge areas were considered in the IHSDM analysis (i.e., IHSDM was used for freeway analysis). Ramp roadway segments were not considered in the analysis given the limitations of Predictive Method, as previously mentioned. The ramp terminal intersections and interchanges were analyzed with the FDOT SPICE and FHWA ICSC tools.

For conducting the predictive analysis, SR 9/I-95 Mainline were segmented into homogenous segments per the HSM methodology. The segmentation aimed to subdivide the SR 9/I-95 mainline into segments with consistent geometry and AADT, to the extent possible. Achieving a consistent geometry was not feasible along several mainline segments due to the complex geometry. In such cases, the crash analysis used an averaging procedure, per HSM methodology. In addition, the proposed geometry of each Build Alternative changed within the different segments making the length of the analysis different for each alternative. The resulting segmentation of the mainlines used for the crash analysis and AADTs are depicted in **Figures 6-1** and **6-2**.

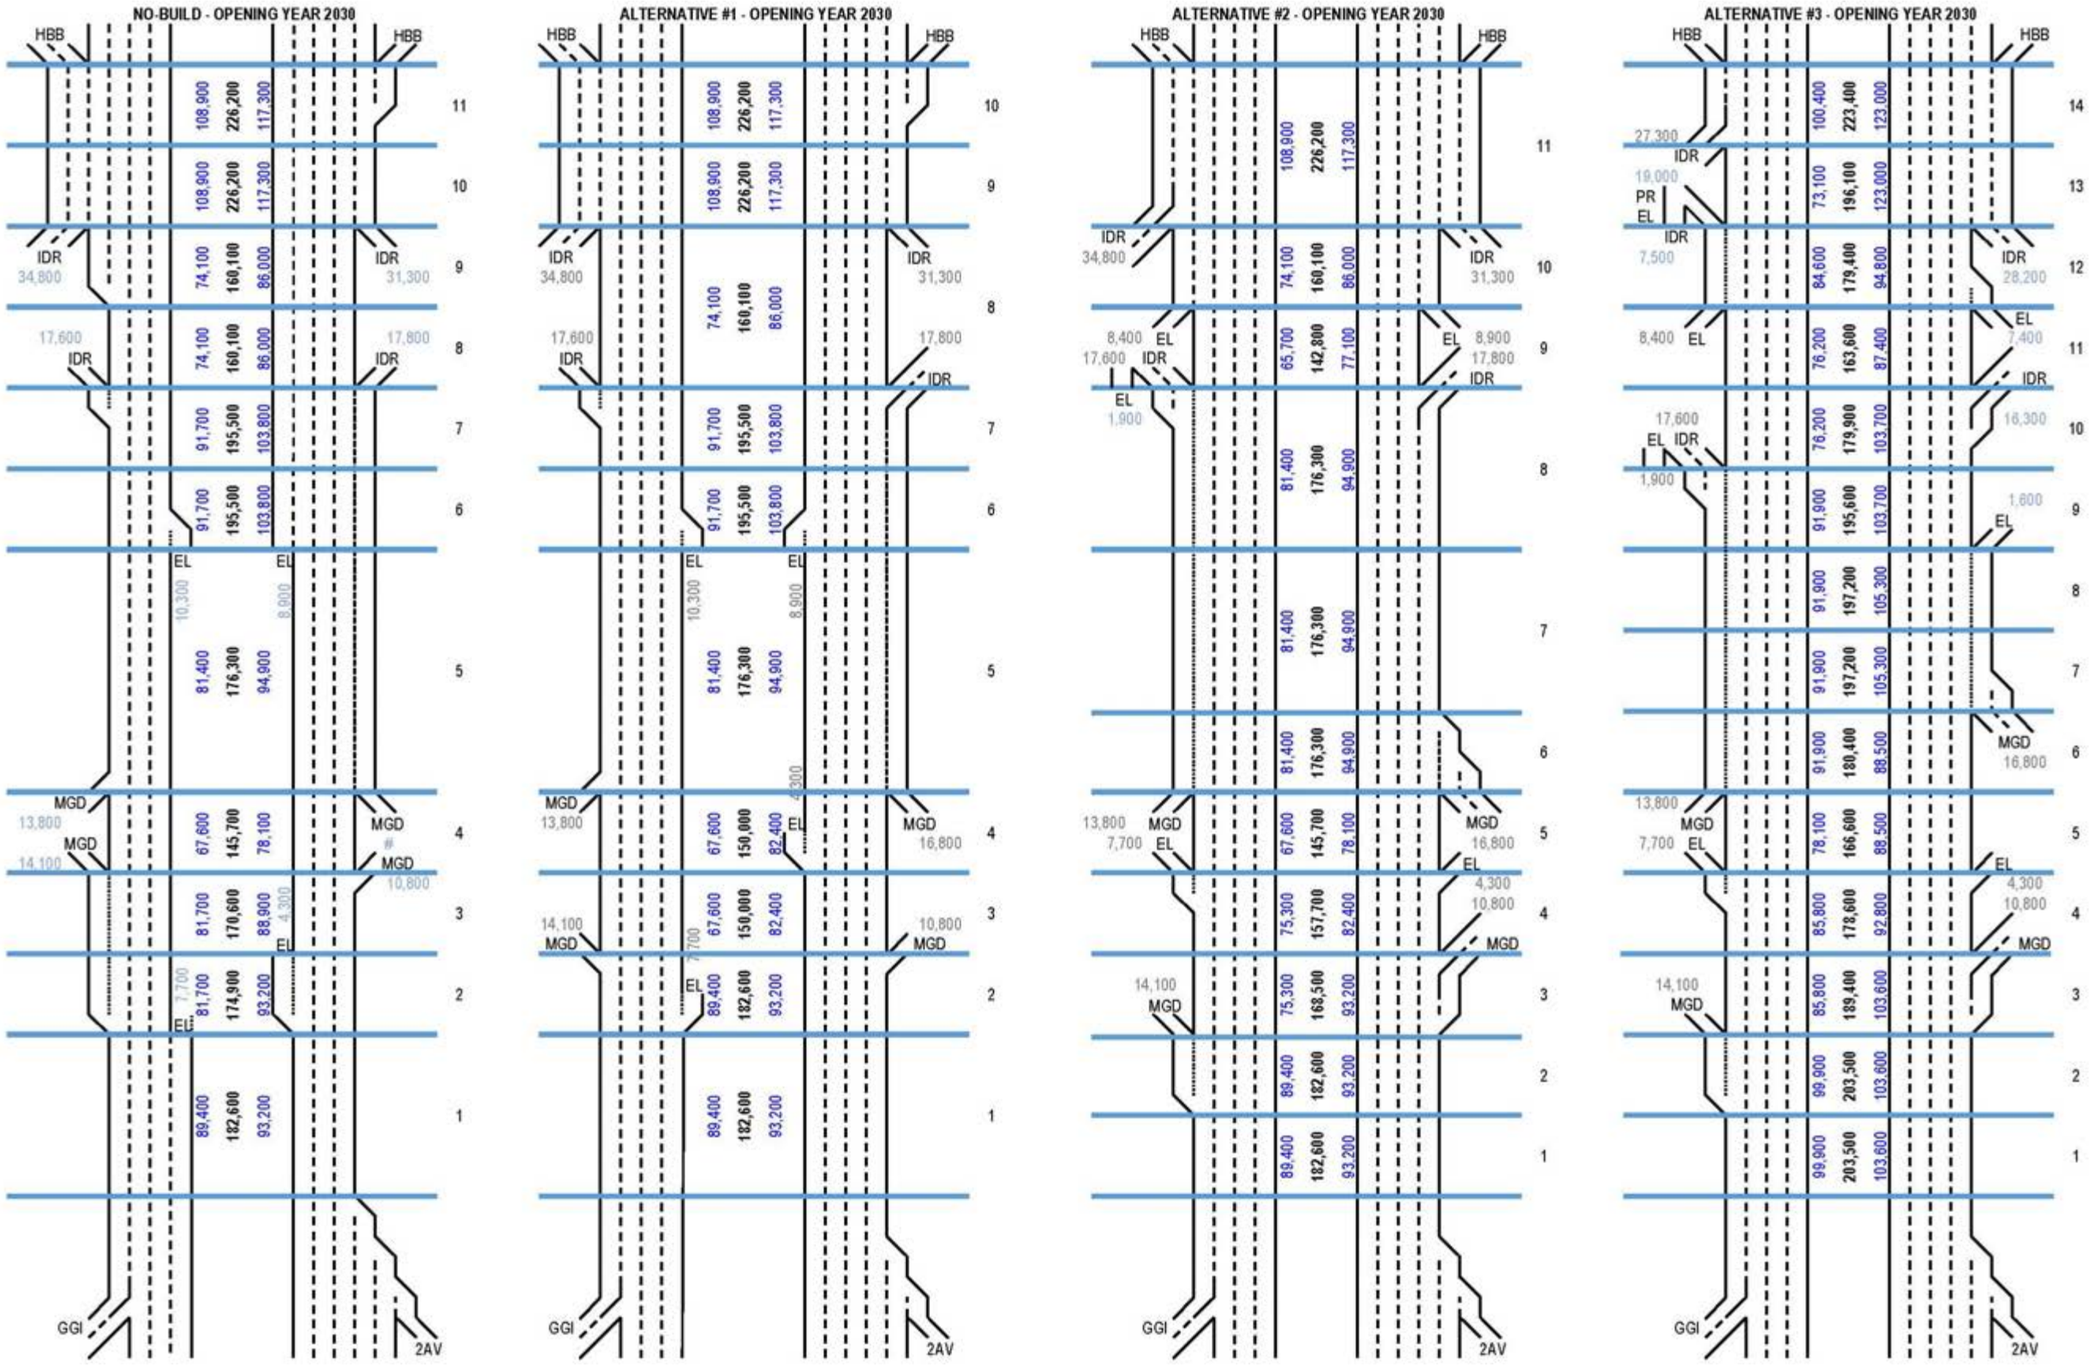

Figure 6.1:
Interactive Highway Safety Design Module (IHSDM)
Segmentation & Opening Year 2030 AADTs

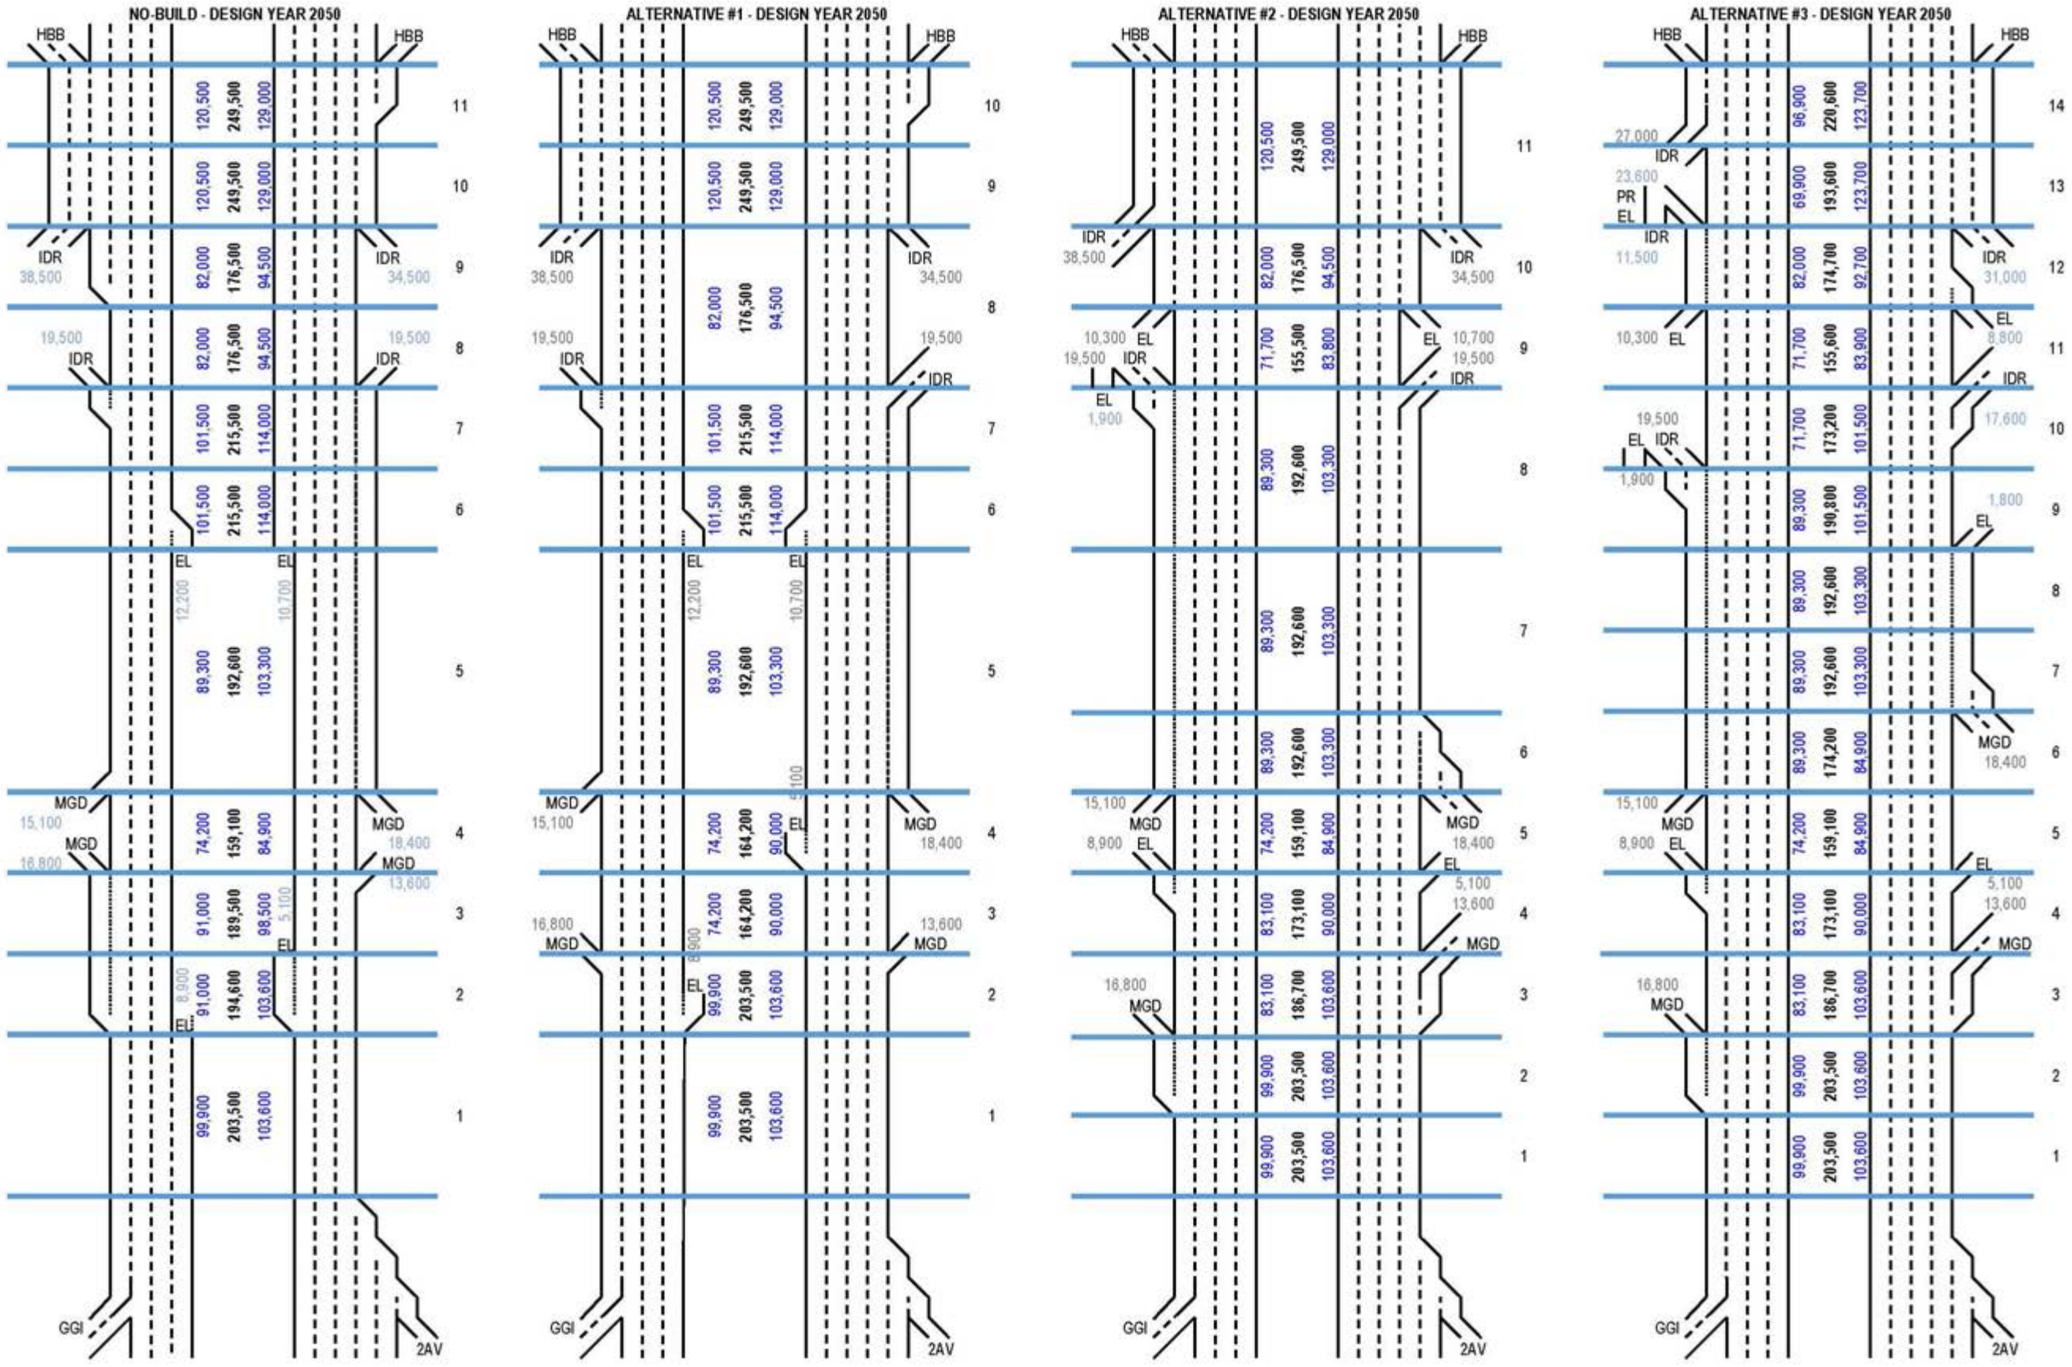

Figure 6.2:
Interactive Highway Safety Design Module (IHSDM) Segmentation & Design Year 2050 AADTs

When analyzing ramp terminals using the Interactive Highway Safety Design Model (IHSDM) software, the predictive method is applicable to certain ramp terminals, but it does not align with the complexity of the terminals requiring analysis, as outlined in the Highway Safety Manual (Pages 19-3 & 19-4). IHSDM has inherent limitations regarding specific interchange types, such as the Diverging Diamond Interchange (DDI), which is not supported by the software, and the Single Point Urban Interchange (SPUI), which is noted as a limitation of the predictive method (Highway Safety Manual, Page 19-78). Given these constraints and the complexity of the ramp terminals being analyzed, additional crash prediction tools are employed for more accurate forecasting. These tools include the Safety Performance for Intersection Control Evaluation (SPICE) tool, developed by the Florida Department of Transportation, and the FHWA Interchange Configuration Safety Comparison Tool, developed by the Federal Highway Administration. For example, the SPICE tool was used to analyze the SR 860/Miami Gardens Drive ramp terminal west of SR 9/I-95 as continuous green at-grade intersection instead of a ramp terminal intersection due to its configuration. These supplementary tools are used to predict future crash occurrences along Miami Gardens Drive and Ives Dairy Road. This decision was made in coordination with IHSDM support team.

The quantitative safety analysis indicates that the Build Alternatives will improve safety conditions over the No-Build Alternative. The analysis also indicates that Build Alternative 3 will produce the highest reduction in predicted crashes (i.e., highest safety improvement). Based on the safety analysis results using the FHWA IHSDM, FDOT SPICE, and FHWA ICSC analysis tools, the proposed Build Alternative 3 would reduce the predicted total project life cycle crashes by a total of 13,270 crashes. Of those 13,270 crashes, 10,437 are predicted to be fatal/injury crashes. **Table 6.1** summarizes the results of the safety analysis for the SR 9/I-95 segments within the study area. A Ranking of 1 is given to the alternative with the lowest total crash rate. Documentation of the Build Alternative traffic safety analysis is provided in **Appendix O.**

Table 6.1 – Safety Analysis Results from 2030-2050

Control Strategy	Crash Type	Average Crash Rate By Year	Total Crashes Project Life	Rank[1]	Source of Prediction
No-Build	Total	1,007	16,587	4	IHSDM[2] SPFs[3] SPICE[4]
	Fatal & Injury	706	11,512		
Build Alternative 1	Total	510	4,173	3	IHSDM[2] SPFs[3] SPICE[4] FHWA[5]
	Fatal & Injury	298	1,335		
Build Alternative 2	Total	445	4,257	2	IHSDM[2] SPFs[3] SPICE[4] FHWA[5]
	Fatal & Injury	134	1,369		
Build Alternative 3	Total	317	3,317	1	IHSDM[2] SPFs[3] SPICE[4] FHWA[5]
	Fatal & Injury	102	1,075		

(1) A Ranking of 1 is given to alternative with the lowest total crash rate
(2) Interactive Highway Safety Design Module (IHSDM) tool
(3) Safety Performance Functions (SPFs)
(4) Safety Performance for ICE (SPICE) tool
(5) FHWA Interchange Configuration Safety Comparison tool

These results are consistent with expectations since several of the crashes experienced along SR 9/I-95 are associated with excessive congestion and weaving activities within segments of the corridor. The proposed improvements under Build Alternative 3 will reduce congestion, weaving activities, conflicts, and corresponding crash risk within the segment of SR 9/I-95 which are currently defined as high crash location segments.

6.2 Qualitative Safety Assessment

As presented in the previous section, the HSM crash prediction procedures encountered limitations due to the unique conditions and complex geometry of the project. Such unique conditions and complex geometry are not covered by the HSM crash prediction methods. Hence, to support the safety analysis of the project a qualitative assessment of the proposed roadway modifications was also considered. The following improvements support expectations that each of the Build Alternative Design Concepts, specially Build Alternative 3 will provide significant safety benefits when compared to the No-Build Condition:

1. Reduction in weaving activity. The proposed braided ramp connections (especially for Express Lane ingress and egress) will reduce weaving in between the interchange ramps. The dedicated express lane connectors will eliminate the need for two-side weaving to/from express lanes and on/off interchange ramps within the identified two high crash segments within the study area: 1) Between the GGI and SR 860/Miami Gardens Drive interchanges; and 2) Between the SR 860/Miami Garden Drive and CR 854/Ives Dairy Road interchanges. Build Alternative 3 will also provide braided ramps between the SB CR 854/Ives Dairy Road Off-Ramp and the Pembroke Road/Express Lane Egress SB On-Ramps. Eliminating weaving activity between these movements will significantly improve operations and enhance safety within this segment, which was otherwise projected to operate at LOS F.

2. Increase interchange capacity. The proposed grade separation configuration at SR 860/Miami Gardens Drive and DDI configuration at CR 854/Ives Dairy Road will significantly increase the capacity of the two Interchanges. The increase in capacity will correspondingly provide congestion relief at the interchanges and reduce associated crashes – particularly rear-end collisions.

3. Reduction in traffic exposure. The proposed direct access to express lanes from CR 854/Ives Dairy Road will eliminate the need for drivers to use the SR 9/I-95 general use lanes to access NB and SB SR 9/I-95 express lanes. This will reduce the amount of traffic using these segments of SR 9/I-95, resulting in a corresponding reduction in traffic exposure and reduction in crash risk at these segments.

4. Minimizing conflict points and reducing traffic speeds. The proposed grade separation configuration at SR 860/Miami Gardens Drive and DDI configuration at CR 854/Ives Dairy Road will improve safety by reducing conflict points and traffic speeds. Crossing conflict points pose the most serious threat to drivers as they increase the risk of severe angle crashes. The conventional diamond intersection has 26 total and 10 crossing conflict points, whereas the DDI has 14 total and 2 crossing conflict points. In addition, DDI geometric features encourage slower traffic speeds through the interchange. This is also applicable at SR 860/Miami Gardens Drive, which will reduce conflicts with the second level and speeds by providing tighter radius. In addition, lowering speed limits on highways is considered to decrease the frequency and severity of pedestrian crashes.

7 OTHER CONSIDERATIONS

7.1 Environmental Considerations

The consideration of social, economic, and environmental impacts discussed in the 2009 policy are removed from this policy, and they will be addressed under the National Environmental Policy Act and other statutes and regulations applicable to the approval process. FDOT is conducting an Environmental Evaluation. At this time, no potential environmental considerations requiring a modification of the Build Alternatives have been identified. Further analysis and coordination are being conducted by FDOT as part of the on-going Environmental Evaluation.

7.2 Anticipated Design Exceptions and Variations

The following design exception and variations are anticipated based on the preliminary design tasks conducted at this time.

- Lane Width Exception

  This exception applies to SR 9/I-95 Mainline (Express and General Use lanes) from Begin Project to End Project. The exception is to provide 11-foot lanes. This design standard deviation is still consistent with the FAC regarding express lane tolling and does not preclude transit on express lanes. This design standard deviation will allow to:

  1. Match proposed design deviations from GGI Ultimate Project (FPID 428358-1-22-01).
  2. Match proposed ultimate conditions from D4 SR 9/I-95 PD&E Study (FPID 436903-1-22-02).
  3. Minimize R/W Impacts corridor wide.
  4. Minimize impacts to Milton Littman Park.
  5. Accommodates several express lane braided ramp envelopes while minimizing ROW impacts.

- Horizontal Curve Length Exception

  This exception applies to ramps at the SR 860/Miami Garden Drive interchange. AASHTO criteria has been used to minimize geometric footprint needed to accommodate ramp movements, which minimizes ROW impacts at the following ramps:

  1. SR 860/Miami Garden Drive WB to SR 9/I-95 NB On-Ramp (DS=25 MPH)
  2. SR 860/Miami Garden Drive WB to SR 9/I-95 SB On-Ramp (DS=25 MPH)
  3. SR 9/I-95 NB On-Ramp from SR 860/Miami Garden Drive (DS=35 MPH)

- Maximum Grade Exception

  This exception applies to ramps at the SR 860/Miami Garden Drive interchange. AASHTO criteria has been used to minimize geometric footprint needed to accommodate ramp movements, which minimizes ROW impacts at the following ramps:

  1. SR 860/Miami Garden Drive EB to SR 9/I-95 NB On-Ramp (DS=25 MPH)
  2. SR 860/Miami Garden Drive WB to SR 9/I-95 SB On-Ramp (DS=25 MPH)
  3. SR 9/I-95 NB On-Ramp from SR 860/Miami Garden Drive (DS=35 MPH)
  4. SR 9/I-95 NB Off-Ramp to NB EL Ingress (DS=40 MPH)

- Vertical Curve Length Exception

  This exception applies to SR 9/I-95 Mainline (Express and General Use lanes) from Begin Project to End Project. AASHTO criteria has been used to meet vertical Clearance requirements under/over proposed fly over ramps. This design standard deviation will allow to Make the Alternative more feasible to build with shorter vertical curve lengths, and it also improves constructability of SR 9/I-95 to match existing conditions.

- Lane Width Variation
  This variation applies to SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road. This design standard deviation will allow to:
  1. Minimize ROW Impacts.
  2. Maximize space for one 11 foot outside lane for transit accommodation.
  3. Provides ability to accommodate bicycle lanes while avoiding significant impacts to the existing bridge over SFRC.
  4. Minimize ROW Impacts to adjacent residencies on the north and south side of the roadway.

- Buffer Width Variation
  This variation applies to SR 9/I-95 between Express Lanes and General Use Lanes from Begin Project to End Project. This design standard deviation is consistent with reduced buffer widths on other SR 9/I-95 express lane segments. This design standard deviation will allow to:
  1. Minimize ROW impacts corridor wide.
  2. Provide wider general use lanes.

- Shoulder Width Variation
  This variation applies to SR 9/I-95 inside and outside shoulders. This design standard deviation will allow to:
  1. Minimize ROW impacts.
  2. Minimize bridge widths over SB SR 860/Miami Gardens Drive and SR 858/Hallandale Beach Boulevard.
  3. Match proposed ultimate conditions from D4 SR 9/I-95 PD&E Study (FPID 436903-1-22-02).
  4. Match proposed design deviations (lane width exception) from GGI Ultimate Project (FPID 428358-1-22-01).

- Stopping Sight Distance Variation
  This variation applies to SR 9/I-95 Express Lane inside shoulder and SR 860/Miami Gardens Drive outside shoulder along auxiliary ramp. This variation has been requested to meet AASHTO stopping sight distance criteria due to reduced shoulders. This design standard deviation will allow to:
  1. Minimize impacts on both sides of the corridor.
  2. Reduce impacts to adjacent residencies by providing a low speed turning radius and reduced shoulders.

- Maximum Grade Variation
  This variation applies to SR 9/I-95. This design standard deviation will allow to meet vertical clearance over SR 860/Miami Gardens Drive, minimize fill quantities and match existing profile.

- Superelevation Rate Variation
  This variation applies to ramps at the SR 860/Miami Garden Drive interchange. Lower design speeds are proposed to minimize the geometric footprint in terms of curve radii and superelevation transitions, which minimizes ROW impacts at the following ramps:
  1. SR 860/Miami Garden Drive WB to SR 9/I-95 NB On-Ramp at SR 860/Miami Garden Drive Intersection (DS=25 MPH)

2. SR 9/I-95 NB Off-Ramp to SR 860/Miami Garden Drive beyond Ramp Terminal (DS=25 MPH)
3. SR 9/I-95 SB Loop Off-Ramp to SR 860/Miami Garden Drive (DS=25 MPH)

- Median Width Variation
  This variation applies to medians along SR 9/I-95, SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road. This design standard deviation will allow to:
  1. Match existing conditions from SR 9/I-95 Phase 2 project (FPID 422796-1-52-01/422796-25-52-01).
  2. Match proposed design deviations from GGI Ultimate Project (FPID 428358-5).
  3. Match existing conditions from SR 9/I-95 Phase 3C Segment 1A Project (FPID 409354-2-52-01).
  4. Maximize space for one 11 foot outside lane for transit accommodation along CR 854/Ives Dairy Road.
  5. Minimize impacts to bridge over SFRC along Miami Gardens Drive.
  6. Provide pedestrian access and improve NB On-Ramp constructability.
  7. Minimize ROW impacts.

- Border Width Variation
  This variation applies to SR 9/I-95 mainline and ramps. This design standard deviation will allow to minimize ROW impacts.

7.3 Conceptual Signing Plan

A conceptual signing plan is provided in **Appendix R**. The conceptual signing plan is consistent with the MUTCD and FDOT guidelines. The conceptual signing plan indicates that it will be feasible to provide adequate signage for Build Alternatives.

7.4 Access Management Plan

The access management plan within the area of influence will not be changed by the proposed improvements to the interchange.

8 FHWA INTERSTATE ACCESS POLICY

It is in the national interest to preserve and enhance the Interstate System to meet the needs of the 21st Century by assuring that it provides the highest level of service in terms of safety and mobility. Full control of access along the Interstate mainline and ramps, along with control of access on the crossroad at interchanges, is critical to providing such service. Therefore, the Federal Highway Administration's (FHWA) decision to approve new or revised access points to the Interstate System under Title 23, United States Code (U.S.C.), Section 111, must be supported by substantiated information justifying and documenting that decision. The FHWA's decision to approve a request is dependent on the proposal satisfying and documenting the following requirements:

8.1 Policy Point 1

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, and ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (Title 23, Code of Federal Regulations (CFR), paragraphs 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The operational analysis conducted for this SIMR confirmed that the proposed interchange modifications for Build Alternative 3 are not expected to have any significant adverse impacts on safety and operations on the interstate facility, SR 9/I-95. When compared with the No-Build Alternative, the Build Alternative 3 improves or maintains operations along SR 9/I-95 mainline within the study interchange and connection to adjacent interchanges.

For Build Alternative 3, the freeway analysis results indicate that all the freeway segments in the study area will be able to serve 90% or more of the projected demand for all the segments in the southbound and northbound directions during the AM and PM peak hour periods. The analysis also indicates that both directions of the Express Lanes and the northbound direction of the General Use Lanes will operate uncongested during both peak hour periods. In addition, all southbound General Use Lane segments will be improved to indicate lightly congested operations. In contrast, under No-Build Alternative, the freeway analysis results indicate that most freeway segments in the study area will experience moderate or heavy congestion during one or both peak hour periods as defined by one of the MOEs. The available capacity will not be able to serve 90% or more of the projected demand for any of the segments in the southbound direction during either the AM or PM peak hour periods. Similarly, all southbound Express Lanes segments during the AM peak hour and southbound Express Lane segment 3 during the PM peak hour will not be able to serve 90% or more of the projected demand.

The intersection analysis results for Build Alternative 1 indicate that the operations at SR 860/Miami Gardens Drive will deteriorate during both the AM and PM Peak Hour periods compared to the No-Build Alternative. These results are mainly due to the reduction of capacity by consolidating the ramp terminals to a single at-grade ramp terminal intersection. The intersection analysis results for Build Alternative 2 indicate that operations at the intersection SR 860/Miami Gardens Drive and SR 9/I-95 Ramps will also deteriorate when compared to the No-Build Alternative. This condition is mainly due to excess weaving and queuing within a short distance between the ramp terminal and the merge point of the northbound and southbound off-ramp upstream of the intersection.

The safety analysis indicates that the majority of SR 9/I-95 within the study area is within a high crash segment. The crash data shows a concentration within the areas with higher traffic friction (i.e., merge, diverge, and weaving), including the access points to and from the Express Lanes. The safety analysis indicates that Rear End and Sideswipe crash types had the highest frequencies; these types of crashes are consistent with reoccurring congestion. To improve safety along the SR 9/I-95 study corridor, the following improvements were recommended for consideration: implement an additional express lane in each direction; implement braided ramps; implement general use and auxiliary lanes; and reduce friction areas.

The quantitative safety analysis indicates that the Build Alternatives will improve safety conditions over the No-Build Alternative. The analysis also indicates that Build Alternative 3 will produce the highest reduction in predicted crashes (i.e., highest safety improvement). Based on the safety analysis results using the FHWA Interactive Highway Safety Design Module and FHWA Interchange Configuration Safety Comparison analysis tools, the proposed Build Alternative 3 would reduce the predicted total project life cycle crashes by a total of 13,387 crashes. Of those 13,387 crashes, 10,454 are predicted to be fatal/injury crashes. These results are consistent with expectations since several of the crashes experienced along SR 9/I-95 are associated with excessive congestion and weaving activities within segments of the corridor. The proposed improvements under Build Alternative 3 will reduce congestion, weaving activities, and corresponding crash risk within the segment of SR 9/I-95 which are currently defined as high crash location segments.

8.2 Policy Point 2

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit or high occupancy vehicle and high occupancy toll lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

This SIMR project does not propose any new interchanges along SR 9/I-95. The existing interchanges provide access to public roads only. The proposed improvements at the interchanges within the study area will maintain full access to the existing crossroads of SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road and all movements are accommodated at both interchanges. The following provide descriptions of the proposed improvements under each Build Alternative.

Build Alternative 1

Alternative 1 is based on the *FDOT District 6 SR 9/I-95 Corridor Planning Study (FM: 414964-6-22-01)*, which evaluated a series of concepts and ultimately refined from 45 initial alternatives to two corridor wide concept alternatives referred as Build Concept 1 and Build Concept 2. Based on the results of the evaluation of Build Concepts 1 and 2 and input from FDOT District 6 staff, a refined or final concept referred to as Refined Build Concept was developed, which is further evaluated as Build Alternative 1 for this PD&E Study.

SR 9/I-95 Mainline and Express Lanes - Alternative 1 proposes a typical section consisting of two continuous express lanes, four general purpose lanes, and one auxiliary lane in each direction from north of the Golden Glades Interchange to the Broward County line. Within the project limits, for Alternative 1 there will continue to be two express lane ingress points. One will be located in the northbound direction between the northbound off- and on-ramps of SR 860/Miami Gardens Drive interchange and the other will be located in the southbound direction north of Snake Creek Canal. There will also continue to be two express lane egress points. One will be located in the southbound direction, south of SR 860/Miami Gardens Drive providing access to the Golden Glades Interchange; and the other in the northbound direction, north of Snake Creek Canal providing access to CR 854/Ives Dairy Road and southern Broward County.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location for both northbound and southbound on and off ramps. This single ramp terminal intersection would be located at the existing ramp terminal intersection on the east side of the SR 9/I-95 corridor with an expanded Turbo 'T' intersection. The existing signalization conditions will remain in place. The eastbound dual left turn lanes are proposed to remain at-grade similar to existing conditions.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound lane is provided to help reduce the congestion of traffic in the area.

Build Alternative 2

Alternative 2 is based on the *FDOT District 4 SR 9/I-95 (SR 9) Planning Study from south of the Golden Glades Interchange to north of the SR 9/I-95 and I-595 Interchange (FM: 436903-1-22-02) in Broward County*. From this Planning Study, two alternatives (Alternative 1 and Alternative 3) were recommended to be considered in this PD&E Study which was further evaluated as Build Alternative 2 for this PD&E Study.

SR 9/I-95 Mainline and Express Lanes - Similar to Alternative 1, Alternative 2 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. A significant difference between Alternative 1 and Alternative 2 is that a series of braided movements are proposed for the express lanes access points, and two auxiliary lanes are provided in each direction for Alternative 2, rather than one auxiliary lane in each direction. In conjunction with the braided ramps, the second auxiliary lane eliminates the need to weave across the general-purpose lanes to access the express lanes.

SR 860/Miami Gardens Drive - The proposed improvements at SR 860/Miami Gardens Drive consist of consolidating the ramp terminal to one location (similar to Alternative 1), but with grade-separated on-ramps. This configuration allows for traffic to free flow onto the mainline, as opposed to Alternative 1, which provides at-grade traffic signal control.

CR 854/Ives Dairy Road - Improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the existing diamond interchange to a Single Point Urban Interchange (SPUI). Similar to Alternative 1, an additional eastbound lane is provided along the arterial.

Build Alternative 3

SR 9/I-95 Mainline and Express Lanes - Alternative 3 was developed based on feedback from the Public Alternatives Workshop. Alternative 3 is based on a combination of Alternative 1 and Alternative 2, with refinements. Alternative 3 proposes a typical section consisting of two continuous express lanes and four general purpose lanes throughout the entire project corridor. Same as in Alternative 2, the braided ramps and additional auxiliary lanes eliminate the need to weave across the general-purpose lanes to access the express lanes.

SR 860/Miami Gardens Drive - Same as in Alternative 2, the proposed improvements at SR 860/Miami Gardens Drive consist of a grade-separated on-ramp. This configuration will allow for traffic to free flow onto the mainline. In addition, the northbound and southbound off ramp will be extended and connected to the west of SR 9/I-95 in advance of the modified single ramp terminal to the east of SR 9/I-95. The purpose for this configuration is to accommodate the weaving friction between these two movements along a longer segment and to increase storage length to avoid spill back into SR 9/I-95 mainline.

CR 854/Ives Dairy Road - Same as in Alternative 1, improvements at CR 854/Ives Diary Road interchange consist of reconfiguring the interchange to a Diverging Diamond Interchange (DDI). An additional eastbound through lane, an additional westbound to northbound on-ramp lane, and new signal timing are provided to help reduce the congestion of traffic in the area.

9 CONCEPTUAL FUNDING

The work program does not show available construction funds for FY 2024-2029. The production date is scheduled for January 2029. The construction schedule is not yet finalized. The following anticipated dates are shown in the work program:

- Design – Fiscal Year 2023
- Right of Way – Fiscal Year 2026-2029
- Construction – Fiscal Year 2032

There are three alternatives being evaluated. Cost estimates have been developed based on an engineer's opinion of probable cost using current FDOT Long Range Estimates (LRE) base costs. The LRE shows the following anticipated cost for each alternative. **Appendix S** presents the LRE calculations dated April 2023:

- Alternative 1 – $336 million
- Alternative 2 – $545 million
- Alternative 3 - $528 million

The current work program has $18.3 million budgeted for design and $528 million for construction. Right of way acquisition is anticipated for this project. The total estimated acquisition purchase in the work program is $26 million.

10 CONCLUSIONS AND RECOMMENDATIONS

The primary purpose of this project is to address the deficient operational capacity and relieve existing/future congestion along the SR 9/I-95 corridor and its interchanges at SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road, which in turn will improve safety and reduce travel time. Other goals of the project are to 1) preserve the operational integrity and regional functionality of SR 9/I-95 (and, therefore, the regional transportation network) by complementing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties and 2) enhance emergency evacuation and response times.

The No-Build Alternative maintains the existing corridor as it is today with no future major improvements other than routine maintenance. Planned and approved adjacent projects in the area (both to the south at the Golden Glades Interchange and to the north in Broward County) are considered, without any proposed changes within the limits of this project.

Build Alternative 1 is based on the *FDOT District 6 SR 9/I-95 Corridor Planning Study (FM: 414964-6-22-01)*. This alternative provides a homogeneous 4-lane SR 9/I-95 Mainline and 2-lane Express Lanes in the southbound and northbound direction, consolidates the ramp terminals to a single at-grade ramp terminal intersection on the east side of SR 860/Miami Gardens Drive, and modifies the CR 854/Ives Dairy Road interchange to a DDI configuration.

Build Alternative 2 is based on the *FDOT District 4 SR 9/I-95 (SR 9) Planning Study from south of the Golden Glades Interchange to north of the SR 9/I-95 and I-595 Interchange (FM: 436903-1-22-02) in Broward County*. This alternative adds braided ramps to and from Express Lanes in the southbound and northbound direction, grade-separation at the consolidated single ramp terminal intersection on the east side of SR 860/Miami Gardens Drive, and modifies the CR 854/Ives Dairy Road interchange to a SPUI configuration.

Build Alternative 3 is based on a combination of Alternative 1 and Alternative 2, with refinements. Refinements include: braided ramps on the southbound direction to eliminate weaving between Pembroke Road on-ramp and CR 854/Ives Dairy Road off-ramp movements, new northbound and southbound off-ramp configuration at SR 860/Miami Gardens Drive interchange to accommodate the weaving friction between northbound and southbound off-ramp movements and increase storage length to avoid spill back into SR 9/I-95 mainline, and new cycle length timing along CR 854/Ives Dairy Road to optimize operations under the DDI configuration.

The purpose and need of this project are supported by the No-Build Alternative operational analysis results. The No-Build Alternative freeway analysis results indicate that most freeway segments in the study area will experience moderate or heavy congestion during one or both peak hour periods as defined by one of the MOEs. The available capacity will not be able to serve 90% or more of the projected demand for any of the segments in the southbound direction during either the AM or PM peak hour periods. Similarly, all southbound Express Lanes segments 2 and 3 operate as heavily congested during the AM and PM Peak Hour periods based on Speed Congestion Level Thresholds and LOS and Demand Served, respectively.

The Build Alternative 3 freeway analysis results indicate that all the freeway segments in the study area will be able to serve 90% or more of the projected demand for all the segments in the southbound and northbound directions during the AM and PM peak hour periods. The analysis also indicates that both directions of the Express Lanes and the northbound direction of the General Use Lanes will operate uncongested during both peak hour periods. In addition, all southbound General Use Lane segments will be improved to indicate lightly congested operations.

Table 10.1 presents a summary of Design Year 2050 intersection analysis results for the No-Build and the three Build Alternatives for ease of reference and comparison. The No-Build intersection analysis results indicate that all the intersections operate at LOS F during the AM Peak Hour period, and LOS E or better during the PM Peak Hour period. However, the No-Build intersection analysis also indicates that the available capacity of the intersections will only be able to process an average of 81% of the projected demand. In addition, there are several movements that operate at LOS E and F, and queuing exceeds available storage. Therefore, all intersections are expected to operate under moderate to heavily congested conditions. The intersection analysis results also indicate that all the intersections in the study area operate at LOS E or better under Build Alternative 3, except for the intersection of CR 854/Ives Dairy Road at Highland Lakes Boulevard, which operates at LOS E or F for all alternatives.

Table 10.1 – Design Year 2050: No-Build and Build Intersection Operational Analysis Results

SR 860/Miami Gardens Drive Intersection with:	No-Build Alternative	Build Alternative 1	Build Alternative 2	Build Alternative 3
SR 9/I-95 SB Ramps/NE 6th Ave	192/F (239/F)	329/F (421/F)	16/B (87/F)	22/C (33/C)
SR 9/I-95 NB Ramps	65/E (103/F)	115/F (150/F)	142/F (128/F)	14/B (14/B)
CR 854/Ives Dairy Road Intersection with:	**No-Build Alternative**	**Build Alternative 1**	**Build Alternative 2**	**Build Alternative 3**
SR 9/I-95 SB Ramps	91/F (96/F)	37/D (79/E)	n/a	28/C (54/D)
SR 9/I-95 NB Ramps	88/F (56/E)	30/C (33/C)	n/a	24/C (26/C)
SR 9/I-95 SB & NB Ramps (SPUI)	n/a	n/a	120/F (78/E)	n/a
Highland Lakes Boulevard	284/F (95/F)	266/F (109/F)	120/F (110/F)	130/F (135/F)

AM (PM) Delay/LOS

Table 10.2 presents the network-wide performance measures for the AM and PM peak hour, which corresponds with the second hour of the vissim model. The network-wide analysis also indicates that Build Alternative 3 provides the highest improvements over the No-Build Alternative operations.

Table 10.2 – Design Year 2050 AM & PM Network-wide Performance Measures

MOE	No-Build Alternative	Build Alternative 1	Build Alternative 2	Build Alternative 3
Average Speed (mph)	19 (27)	26 (22)	19 (25)	39 (38)
Total Delay (hr)	3,408 (1,946)	2,274 (2,881)	3,414 (2,202)	608 (674)
Latent Delay (hr)	1,346 (6,246)	745 (1,412)	268 (106)	5 (4)
Latent Demand	2,763 (8,599)	1,604 (2,362)	1,006 (323)	10 (6)
Total Travel Time (hr)	5,551 (4,034)	4,434 (4,906)	5,550 (4,526)	3,106 (3,124)
Total Stops	914,030 (443,793)	432,419 (993,559)	2,559,462 (1,585,287)	39,635 (35,248)
Vehicles Arrived	24,870 (24,784)	25,679 (23,612)	23,531 (25,166)	27,928 (27,109)
Vehicles Active	5,662 (4,325)	4,794 (6,165)	7,591 (5,768)	3,099 (3,228)

The safety analysis was conducted for future No-Build and Build Alternatives for the SR 9/I-95 corridor using the FHWA IHSDM, FDOT SPICE, and FHWA ICSC tools. These tools calculate crash frequency and severity by utilizing HSM strategies to perform a comparative predictive safety analysis based geometric elements, such as alignment and cross section data, roadside and ramp access data and annual average daily traffic (AADT). **Table 10.3** summarizes the results of the safety analysis for the SR 9/I-95 segments and the interchanges within the study area. A Ranking of 1 is given to the alternative with the lowest total crash rate.

The quantitative safety analysis indicates that the Build Alternatives will improve safety conditions over the No-Build Alternative. The analysis also indicates that Build Alternative 3 will produce the highest reduction in predicted crashes (i.e., highest safety improvement). Based on the safety analysis results using the FHWA IHSDM, FDOT SPICE, and FHWA ICSC analysis tools, the proposed Build Alternative 3 would reduce the predicted total project life cycle crashes by a total of 13,270 crashes. Of those 13,270 crashes, 10,437 are predicted to be fatal/injury crashes. These results are consistent with expectations since several of the crashes experienced along SR 9/I-95 are associated with excessive congestion and weaving activities within segments of the corridor. The proposed improvements under Build Alternative 3 will reduce congestion, weaving activities, conflicts, and corresponding crash risk within the segment of SR 9/I-95 which are currently defined as high crash location segments.

Table 10.3 – Safety Analysis Results from 2030-2050

Control Strategy	Crash Type	Average Crash Rate By Year	Total Crashes Project Life	Rank(1)	Source of Prediction
No-Build Alternative	Total	1,007	16,587	4	IHSDM(2) SPFs(3) SPICE(4)
	Fatal & Injury	706	11,512		
Build Alternative 1	Total	510	4,173	3	IHSDM(2) SPFs(3) SPICE(4) FHWA(5)
	Fatal & Injury	298	1,335		
Build Alternative 2	Total	445	4,257	2	IHSDM(2) SPFs(3) SPICE(4) FHWA(5)
	Fatal & Injury	134	1,369		
Build Alternative 3	Total	317	3,317	1	IHSDM(2) SPFs(3) SPICE(4) FHWA(5)
	Fatal & Injury	102	1,075		

(1) A Ranking of 1 is given to alternative with the lowest total crash rate

Florida Department of Transportation Interchange Access Request (IAR) Methodology Letter of Understanding (MLOU)

Type of Request: ☐ IJR ☐ IMR ☐ IOAR ☒ SIMR

Type of Process: ☒ Programmatic ☐ Non-Programmatic ☐ Other

I-95/SR 9 from South of Miami Gardens Drive to Broward County Line

Systems Interchange Modification Report (SIMR)

FPID: 414964-1-22-01

Coordination of assumptions, procedures, data, networks, and outputs for project traffic review during the access request process will be maintained throughout the evaluation process.

Full compliance with all MLOU requirements does not obligate the Acceptance Authorities to accept the IAR.

The Requestor shall inform the approval authorities of any changes to the approved methodology in the MLOU and an amendment shall be prepared if determined to be necessary.

1.0 Project Description

Provide background or supporting information that explains the basis for the request.

A. Purpose and Need Statement

Provide the Purpose, the Need, and the Goals and Objectives.

This document serves as the Methodology Letter of Understanding (MLOU) between the Requestor, the Florida Department of Transportation (FDOT) District Six, and FDOT Central Office for preparing the System Interchange Modification Report (SIMR) for the I-95/SR 9 with SR 860/Miami Gardens Drive and Ives Dairy Road Interchanges in Miami-Dade County, Florida.

The purpose of this project is to address the deficient operational capacity and relieve existing/future congestion along the I-95/SR 9 corridor and its interchanges at SR 860/Miami Gardens Drive and Ives Dairy Road, which in turn will improve safety and reduce travel time. Other goals of the project are to 1) preserve the operational integrity and regional functionality of I-95/SR 9 (and, therefore, the regional transportation network) by complementing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties and 2) enhance emergency evacuation and response times.

Within the project limits, I-95/SR 9 is classified as 'Urban Principal Arterial Interstate' and consists of six to eight general use lanes and two to four express lanes; the typical section varies throughout the project segment. This particular section of the corridor is located north of the Golden Glades Interchange in northern Miami-Dade County and traverses five U.S. Census Designated Places, including North Miami Beach, Ojus, Ives Estates, Pembroke Park, and Hallandale Beach. It connects to SR 860/Miami Gardens Drive and Ives Dairy Road, two important east-west facilities within northern Miami-Dade County. Existing right-of-way along the project segment ranges from approximately 300 feet to over 1,000 feet in width.

It should be noted that the greater I-95/SR 9 corridor is part of Florida's Strategic Intermodal System (SIS) highway network and is a designated state hurricane evacuation route. In addition, I-95/SR 9 serves a critical role in facilitating the north-south movement of traffic in southeast Florida as one of two major expressways (Florida's Turnpike being the other) that connect the major employment centers and residential areas between Miami-Dade, Broward, and Palm Beach Counties. The corridor traverses dense urban areas with predominantly commercial and residential uses, including downtown Miami.

Based on the information summarized in the *I-95/SR 9 Project Development and Environment (PD&E) Study Scoping Report*, I-95/SR 9 in Miami-Dade County is one of the most heavily traveled sections of urban interstate in the nation. According to data extracted from the FDOT 2018 Florida Traffic Online database and the Southeast Regional Planning Model (SERPM), the existing and future traffic conditions for the I-95/SR 9 project segment are as follows:

- The 2018 Annual Average Daily Traffic (AADT) volume is projected to grow from 216,500 vehicles per day (vpd) - 249,000 vpd to 228,300 vpd - 297,800 vpd in 2045.

- The 2018 Annual Average Daily Truck Traffic (AADTT) volume is projected to increase from 7,145 truck trips per day -8,217 truck trips per day to 7,534 truck trips per day - 9,827 truck trips per day in 2045 [assuming the percentage of trucks on the road remains the same as the base year percentage (3.30%)].

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

- A safety analysis was completed for the corridor as part of the *Interstate 95 Corridor Planning Study* using crash data for the I-95/SR 9 mainline, on- and off-ramps, and arterials in the study corridor. Crash data was obtained from FDOT's Crash Analysis Reporting System (CARS) for the most recent five years of verified crash data at the time of the analysis (i.e., from January 2009 to December 2013). The analysis indicated the following:
  - Rear-end crashes was the predominant crash type.
  - There was a total of 462 crashes at the I-95/SR 9 and SR 860/Miami Gardens Drive Interchange study area. Approximately 63% of the crashes at this interchange occurred at the I-95/SR 9 SB Ramps.
  - There was a total of 336 crashes at the I-95/SR 9 and Ives Dairy Road Interchange study area. Approximately 39% of the crashes at this interchange occurred at the I-95/SR 9 SB Ramps and 32% of the crashes at this interchange occurred at Ives Dairy Road and Highland Lakes Boulevard intersection.

Accordingly, growth projected for Miami-Dade County, as identified in the Miami-Dade Transportation Planning Organization (TPO) 2045 Long Range Transportation Plan (LRTP), is as follows:

- County population is forecasted to increase from 2.7 million in 2020 to 3.5 million in 2045

- County employment is projected to grow from 1.3 million in 2015 to 1.8 million in 2045

Based on the traffic operations analysis for the *Interstate 95 Corridor Planning Study* conducted by the FDOT in May 2019, sections of this I-95/SR 9 project segment operate at Level of Service (LOS) F in the peak periods of travel. It is important to note that the existing express lanes along much of the corridor are also operating near capacity, negatively impacting their ability to provide travel time savings to vehicles on I-95/SR 9. The *Interstate 95 Corridor Planning Study* also shows that the ramp terminal intersections operate at LOS F and produce queues impacting through movements and adjacent intersections.

The regional roadway system is also close to build-out and the ability to add more traffic lanes is limited. Without improvements, the project corridor will continue to experience high delays and operate at LOS F in 2045; driving conditions for residents and commuters will also deteriorate well below acceptable LOS standards. Overall, the project will offer enhanced mobility options for motorists and transit users as it will provide additional capacity along the I-95/SR 9 corridor throughout northern Miami-Dade County. Consistent with the existing express lanes system on I-95/SR 9, the additional express lanes are anticipated to operate using variable toll pricing based on congestion to optimize traffic flow. While additional right-of-way for this project section is not currently anticipated, specific right-of-way requirements will be determined during the PD&E Study.

The analysis has the following project objectives:

- Address the deficient operational capacity and relieve existing/future congestion along the I-95/SR 9 corridor and ramp terminal intersections.

- Preserve the operational integrity and regional functionality of I-95/SR 9 (and, therefore, the regional transportation network) by complementing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties.

- Enhance emergency evacuation and response times.

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

The proposed improvements stem from the Refined Build Concept that was developed as part of the *Interstate 95 Corridor Planning Study*, that assessed enhancements along the length of the I-95/SR 9 corridor within Miami-Dade. As such, this project is part of a larger effort to improve the I-95/SR 9 corridor within Miami-Dade County and regionally within Broward and Palm Beach Counties. The study's preferred alternative was recommended for further consideration in the Project Development phase to provide additional capacity while minimizing modifications to programmed/planned improvements pertaining to other projects along the I-95/SR 9 corridor, as well as to reduce right-of-way acquisition/impacts and construction costs. General design parameters for the corridor include minimum 11-foot wide travel lanes, 10-foot wide express lane inside shoulders, and 4-foot wide buffers with tubular markers between the express lanes and general use lanes; 12-foot lanes are generally provided in segments that include more extensive reconstruction/widening, and 11-foot lanes are utilized in areas where modifications are less extensive or needed to match the existing/ programmed/planned geometry.

B. *Project Location*

Provide project description and a map of the IAR project location.

This project entails potentially providing additional express and/or general use lanes on I-95/SR 9, from south of Miami Gardens Drive Interchange (MP 13.724) to Broward County Line (MP 17.199), in Miami-Dade County, Florida. This project will also assess improvements at the I-95/SR 9 interchanges with SR 860/Miami Gardens Drive and Ives Dairy Road. **Exhibit A** provides a Project Location map.

C. *Area of Influence*

Provide a description of the area of influence along the main line and cross street.

In urban areas, the area of influence (AOI) as defined in the *2020 FDOT Interchange Access Request Users Guide* for SIMRs, extends to the on- off-ramp gore points of the adjacent interchanges and to include at least one signalized intersection in either direction within half-a-mile of the interchanges. However, these limits have been modified, as follows:

Along mainline:
I-95/SR 9, from the on- and off-ramp gore points from/to SR 7/US-441 (on the southern limit) to the off- and on-ramp gore point to/from Hallandale Beach Boulevard (on the northern limit).

Along crossroads:
The AOI along SR 860/Miami Gardens Drive extends from NE 2nd Avenue to NE 10th Avenue, including the following signalized intersections:

- SR 860/Miami Gardens Drive at NE 2nd Avenue;
- SR 860/Miami Gardens Drive at NE 2nd Court;
- I-95/SR 9 SB Ramp Terminal/NE 6th Avenue (SR-915) at SR 860/Miami Gardens Drive;
- I-95/SR 9 NB Ramp Terminal at SR 860/Miami Gardens Drive; and
- SR 860/Miami Gardens Drive at NE 10th Avenue.

The AOI along Ives Dairy Road extends from NE 15th Court to Highland Lakes Boulevard, including the following intersections:

- Ives Dairy Road at NE 15th Court;
- Ives Dairy Road at NE 16th Avenue;
- I-95/SR 9 SB Ramp Terminal at Ives Dairy Road;
- I-95/SR 9 NB Ramp Terminal at Ives Dairy Road; and
- Ives Dairy Road at Highland Lakes Boulevard.

Exhibit B summarizes the AOI and interchange spacing within the SIMR limits.

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

D. Project Schedule

Identify the schedule of production activities consistent with a proposed conceptual funding plan and opening year.

The work program does not show available construction funds for Fiscal Year (FY) 2022-2026. The current start Construction Year is 2026. The exact scope is not yet finalized; however, Scheduled Activities are as follows:

- Design FY 2024
- Plans Completed – FY 2026
- Construction Clear Date – FY 2026
- Production Date – FY 2026

2.0 Analysis Years

A. Travel Demand Model

- Base year 2015
- Horizon year 2045

B. Traffic Operational Analysis

- Existing year 2019/2021 *
- Opening year 2030
- Design year 2050

* Current traffic patterns are still being impacted by the COVID 19 pandemic and economic impacts/recovery. However, these impacts (even though significant) are expected to be temporary. Therefore, Existing Year conditions will be developed from on-going 2021 data collection, available historical data and previous studies provided by FDOT. However, the 2021 data has not been assessed yet to identify if it represents post COVID impacts traffic patterns. The traffic volumes will be normalized to represent one (1) analysis year (either 2019 or 2021).

3.0 Alternatives

The No-Build and Build alternatives shall be analyzed in the IAR. Details of all reasonable build alternatives considered, including those eliminated from further considerations, shall be documented. The documentation for the alternatives eliminated can be minimal like a summary of what was considered, reasons for elimination etc. Build Alternatives meeting purpose and need of the project shall have a more detailed description and evaluated in the IAR. The implementation of Transportation Systems Management and Operations (TSM&O) elements will be incorporated in the IAR Recommended Alternative.

The No-Build and Build alternatives will be analyzed for Opening and Design years. The No-Build alternative will be developed from existing conditions plus any committed projects in the adopted Metropolitan Planning Organization (MPO) Transportation Improvement Program (TIP), Statewide Transportation Improvement Program (STIP), Local Government Comprehensive Plan (LGCP), MPO LRTP and Cost Feasible Plan (CFP), FDOT's Adopted Five-Year Work Program, SIS Second Five-Year Work Program and SIS Modal Plan.

The proposed improvements for two Build alternatives will stem from the Refined Build Concept that was developed as part of the *Interstate 95 Corridor Planning Study*. The study's preferred alternative was recommended for further consideration in the Project Development phase to provide additional capacity

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

while minimizing modifications to programmed/planned improvements pertaining to other projects along the I-95/SR 9 corridor, as well as to reduce right-of-way acquisition/impacts and construction costs. Two Enhanced Alternatives will be developed and analyzed. A stand-alone TSM&O Alternative will not be developed. The implementation of TSM&O elements will be incorporated in the IAR Recommended Alternative. Development of the conceptual design alternatives will follow Context Sensitive Solution and Complete Streets approaches.

4.0 Data Collection

The type of data that may be used should be identified.
If feasible, data would be collected from available sources.

A. Transportation System Data

a. Roadway Characteristics Inventory Database
b. FDOT Straight Line Diagrams (SLD)
c. Miami-Dade County traffic signal timing data
d. Field visits to confirm geometry, storage lengths, signal phasing, operations.
e. FDOT Five-Year Work Program (FY 2022/2026)
f. SIS Funding Strategy First Five-Year Plan (FY 2020/2021 through FY 2024/2025)
g. SIS Funding Strategy Second Five-Year Plan (FY 2025/2026 through FY 2029/2030)
h. SIS Long Range CFP (FY 2029/2045)
i. Miami-Dade TPO Commitment 2045 LRTP (Adopted 09/26/2019 – Amendment #1 12/19/2019 and Amendment #2 04/23/2020)
j. Miami-Dade TPO TIP (FY 2021/2022 through 2025/2026)

B. Existing and Historical Traffic Data

a. FDOT Florida Traffic Online (FTO) Website (Including 2021 data along I-95/SR 9 to be provided by FDOT in advance of internet posting)
b. Regional Integrated Transportation Information System (RITIS)
c. FDOT Crash Data (Crash Analysis Reporting System – CAR Online)
d. *FDOT Interstate 95 Corridor Planning Study from US 1/SR 5 to Broward County Line (FM # 414964-6-22-01)*
e. *FDOT I-95 (SR 9) Planning Study from south of the Golden Glades Interchange to north of the I-95/I-595 Interchange (FM #: 436903-1-22-02)*
f. 72-hour automatic traffic machine counts (approach volumes and departure volumes at 15-minute increments) and 6-hour turning movement counts (6:30 AM to 9:30 AM and 3:30 PM to 6:30 PM) will be provided by FDOT for the following intersections:
   - SR 860/Miami Gardens Drive at NE 2nd Avenue;
   - SR 860/Miami Gardens Drive at NE 2nd Court;
   - I-95/SR 9 SB Ramp Terminal/NE 6th Avenue (SR-915) at SR 860/Miami Gardens Drive;
   - I-95/SR 9 NB Ramp Terminal at SR 860/Miami Gardens Drive;
   - SR 860/Miami Gardens Drive at NE 10th Avenue;
   - Ives Dairy Road at NE 15th Court;
   - Ives Dairy Road at NE 16th Avenue;
   - I-95/SR 9 SB Ramp Terminal at Ives Dairy Road;
   - I-95/SR 9 NB Ramp Terminal at Ives Dairy Road; and
   - Ives Dairy Road at Highland Lakes Boulevard.

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

C. *Land Use Data*
The Miami-Dade County Current Zoning, April 2021; Existing Land Use Map, July 2015; and Adopted 2020/2030 Land Use Plan, October 2013 will be reviewed and documented in the SIMR.

D. *Environmental Data*
Environmental data collection and analysis will be provided through the on-going Categorical Exclusion Type II Environmental evaluation efforts. Environmental considerations (if any) will be used to prepare preliminary evaluations of the environmental impacts for the SIMR.

E. *Planned and Programmed Projects*
Applicable master plans, SIS Plans, FDOT's Five-Year Work Program, I-95/SR 9 corridor and interchange planning and safety studies performed by FDOT District Six, and Miami-Dade TPO TIP, Miami-Dade TPO 2045 LRTP, and City of North Miami Beach comprehensive plan, will be reviewed and documented in the I-95/SR 9 from South of SR 860/Miami Gardens Drive to Broward County Line SIMR. The SIMR improvements will be developed consistent with these plans or steps will be taken to achieve consistency.

5.0 Travel Demand Forecasting

A. *Selected Travel Demand Model(s)*
The SERPM, Version 8.512 will be used for travel forecasting for this project. SERPM 8.512 is an Activity-Based Model (ABM) that simulates both household-level and person-level travel choices including intra-household interactions with household members. SERPM 8.512 model is validated to Year 2015 conditions and includes a future year 2045 scenario based on the adopted cost feasible plans from Miami-Dade TPO, Broward MPO, and Palm Beach Transportation Planning Agency (TPA). It is approved by the Regional Transportation Technical Advisory Committee - Modeling Subcommittee (RTTAC-MS) in South Florida for transportation engineering and planning studies. The RTTAC-MS comprises representatives from FDOT District 4, District 6, and the three planning agencies in South Florida.

B. *Project Traffic Forecast Development Methodology*
Describe the methodology and assumptions in developing the future year traffic volumes, AADT and Directional Design Hour Volumes (DDHV)
The project traffic estimates for the I-95/SR 9 from South of Miami Gardens Drive to Broward County Line SIMR will be developed based on *2019 FDOT Project Traffic Forecasting Handbook* procedures; and it will be use time of day (applying diurnal factors as opposed to applying K and D factors), consistent with previous and on-going projects in the area. Horizon year 2045 No-Build and Build scenarios will be modeled. For opening year 2030, traffic volumes will be interpolated between 2019/2021* existing year and future year 2045. For design year 2050, traffic volumes will be extrapolated from future year 2045.

Origin-destination matrices will be developed for the three-hour AM peak period and the four-hour PM peak period. These matrices will be sliced to develop an AM peak hour matrix and a PM peak-hour matrix. The AADT volumes will be forecasted from the summation of all the time periods. Turning movement volumes will be developed for the analyses of AM and PM peak hour periods using the FDOT TMTool. Volumes will be checked for reasonableness and balanced.

C. *Validation Methodology*
Describe the validation methodology using current FDOT procedures and data collection procedure Identify how modifications to the travel demand forecasting model will be made, including modifications to the facility type and area type for links, modifications to socio-economic data and all input and output modeling files for review.

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

The SERPM 8.512 model has already been validated to Year 2015 conditions following the standard model validation procedures and principles and best practices in the industry. In addition, a tight subarea validation will be conducted, including I-95/SR 9 mainline, interchange ramps and arterial segments within the AOI. A 2019 SERPM model scenario will be developed using 2019 network and socioeconomic data. The 2019 socioeconomic data will be developed by interpolating between the 2015 and 2045 socioeconomic data sets. The 2019 network will be developed by desktop review of the 2015 network and updating it to 2019 conditions. The transportation network and socio-economic/land use data will be reviewed and updated to reflect the approved elements of the MPO/TPO/TPA cost feasible long-range transportation plan, master plans and planned development mitigation infrastructure improvements anticipated to be in place. Various model network attributes (facility types, number of lanes, area types, posted speed, tolls for tolled lanes, geometric connections, turn penalties, centroid location, and connections), within the subarea, will be reviewed and corrected as needed. Root Mean Square Error (RMSE) and Volume-Over-Count Ratio targets were used to evaluate the model validation outputs in accordance with the Florida Standard Urban Transportation Model Structure (FSUTMS) CUBE Framework Phase 2. If applicable, future year model volumes will be adjusted due to base year model volume deviations based on *NCHRP Report 255* guidelines using Ratio and/or Difference adjustments.

D. *Adjustment Procedures*
Identify the process used to adjust modeled future year traffic to the defined analysis years. Discuss how trends/growth-rates will be factored into this, if applicable.

The model results will be post-processed using the *2019 FDOT Project Traffic Forecasting Handbook*, *National Cooperative Highway Research Program (NCHRP) Report 255* and *NCHRP Report 765* recommendations. A corridor prototype spreadsheet will be developed with separate workbooks for AM peak-hour, PM peak-hour and AADT volumes. The volumes will be balanced and smoothed as needed. If by any chance any negative/unreasonable link or turn volumes are forecasted based on the model, adjustments will be performed. The growth rates of the forecasted volumes will be compared against growth trends. Any outlier links will be postprocessed. A future year link volume will be adjusted using two factors: the ratio of the actual base year traffic count to the base year model volume and the numerical difference between the actual base year traffic count and the base year model volume. The ratio and difference adjustments will be checked against a minimum growth rate of 0.5% per year for reasonableness.

E. *Traffic Factors*

- Utilizing recommended ranges identified in the *Project Traffic Forecasting Handbook* and Procedure (525-030-120).

- Utilizing other factors, identified below

Description:
The diurnal factors are the peak period to peak-hour conversion factors and will be determined based on the traffic data collected. The diurnal factors will be compared against the values used in the previous planning study. The corridor traffic count profile by hour will be examined within the peak periods as well as the diurnal factors for the various I-95/SR 9 mainline stations by direction. An average of the factors will be considered in the development of the design traffic. The variation in diurnal factors in an urban area is not significant from one station to the other.

The T24 factor is the adjusted annual 24-hour percentage of truck traffic. The T24-factor will be obtained from available classification counts and compared to the historical factors obtained from the FDOT permanent count stations to assess reasonableness of the data. The Design Hour Truck

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

(DHT) factor is the percentage of truck traffic during the peak-hour and is assumed to remain constant through the design year. It will be estimated as half of the T24 factor per *2019 FDOT Project Traffic Forecasting Handbook* guidelines.

The Peak Hour Factor (PHF) is applied to the traffic counts to convert hourly flow to peak 15-minute flow rate for capacity analysis. Existing Year Freeway (HCS) and Intersection (Synchro) analyses will use PHF to be obtained from the existing counts. Future Year analyses will use a PHF of 0.95 per *2021 FDOT Traffic Analysis Handbook* guidelines. However, an intersection PHF of 1.0 will be used for intersections with Adaptive Signal Control for Existing and Future Years Intersection (Synchro) analyses, if applicable. The Highway Capacity Manual (HCM) uses the PHF to convert an hourly volume into a peak 15-minute flow rate to account for subhourly variations in flow. Adaptive signal control technology adjusts traffic signal timing in real-time to account for subhourly variations in flow. Therefore, using a PHF of 1.0 will provide a more accurate representation of the traffic signal control operations. The traffic factor development process will be documented in detail in the SIMR report.

6.0 Traffic Operational Analysis

The area type, traffic conditions, and analysis tools to be used are summarized in this section.

A. Existing Area Type/Traffic Conditions

Area Type	Conditions	
	Under Saturated	Saturated
Rural	☐	☐
Urban Area/Transitioning Area	☐	☒

A review of the *FDOT I-95/SR 9 Corridor Planning Study Miami-Dade County FM #414964-6-22-01, Existing Conditions Operational Analysis, July 2017* indicates that some segments within the study area exhibit Saturated Conditions.

B. Traffic Analysis Software Used

Software		System Component					
		Freeway				Crossroad	
Name	Version	Basic Segment	Weaving	Ramp Merge	Ramp Diverge	Arterials	Intersections
HCS	7.9.6	☒	☒	☒	☒	☐	☐
Synchro	11.1.0.8	☐	☐	☐	☐	☐	☒
Corsim		☐	☐	☐	☐	☐	☐
Vissim	21 (SP10)	☒	☒	☒	☒	☐	☐
Other		☐	☐	☐	☐	☐	☐

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

As indicated in the Traffic Analysis Software Used table, there is an overlap on the use of HCS and Vissim software for the analysis of Freeways. Both software will be used for analyzing existing and future No-Build and Build scenarios. However, HCS will be used through the development of enhanced alternatives; and Vissim will be used for final comparison of each scenario and alternatives. It should also be noted that both software will be used for Complex Weave Analysis; Method 1: Individual Elements Analysis (HCM Based); and Method 2: V/C Ratio Using Vissim in compliance with *2021 FDOT Traffic Analysis Handbook.*

C. *Calibration Methodology*

- *Calibration methodology and parameters utilized will be documented.*
- *Calibration Measures of Effectiveness (MOEs) and calibration targets.*

Calibration will be conducted and documented based on the guidelines presented on the *2021 FDOT Traffic Analysis Handbook*.

The calibration process for Synchro intersection analysis will consist of comparing the queuing results and visual field audits. Reasonableness checks will be performed by comparing the synchro calculated queues and the queues observed along the arterial intersections. Special consideration will be given to 95th percentile queue lengths that are tagged with "#" or "m". These queue results will be examined for the extent of queuing problems. The "#" indicates that the volume for the 95th percentile cycle exceeds capacity. The "m" indicates that volume for the 95th percentile queue is metered by an upstream signal.

The Vissim model will be created in compliance with guidance to Vissim Model Development. The Vissim Model Verification (Error Checking) Process Checklist will be filled out. Logical field data collection locations will be selected to match the data collection points in the simulation network to obtain comparable results. Travel time, speed and processed volume profiles from the simulation outputs will be compared against data from the FDOT RITIS system or other available data sources to ensure that the simulation provides similar trends and areas of congestion. I-95/SR 9 Off-Ramp queues at ramp terminal intersections will be calibrated to be within 20% difference between simulated and observed queue lengths. The number of required runs, calibration targets and calibration parameters will be determined using the formulas and tables included in the *2021 FDOT Traffic Analysis Handbook*.

D. *Selection of Measures of Effectiveness*

- *The Level of Service criteria for each roadway classification, including mainline, ramps, ramp terminal intersections and the crossroad beyond the interchange ramp terminal intersections are identified below.*

FDOT Topic No. 000-525-006-c provides LOS Targets for the State Highway System (SHS). The automobile mode LOS D target is considered applicable for this SIMR within an urbanized area. It should be noted that LOS is established based on HCM criteria. However, the reported LOS results from the Vissim microsimulation will be in accordance to Section 9.6 of the *2021 FDOT Traffic Analysis Handbook.* This chapter outlines the approach to estimate LOS using density and speed results obtained from microsimulation analysis.

- *In addition to the LOS criteria, state other operational MOEs to be utilized for the evaluation of alternatives.*

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

The Vissim analysis will compare MOEs for the No-Build and two Build Alternatives. Vissim MOEs will be assessed for a simulation period covering a total of 3 ½ hours in the AM period and 3 ½ hours in the PM period for each alternative scenario. The simulation periods will include the following:

- AM Period: ½ hour seeding + 3-hour AM peak period
- PM Period: ½ hour seeding + 4-hour PM peak period

Freeway (Vissim) MOEs

- Link MOEs (Estimated LOS, Density (veh/mi/ln), Speed (mph), Travel Time (seconds), Simulated Volume (reported along with Demand Volume and percent served comparison)
- Complex Weave MOEs (simulated volume reported along with Demand Volume and percent served comparison, speed, density within the complex weave segment and V/C ratio)
- Vissim Network MOEs (Total Delay (hours), Average Delay (seconds per vehicle), Total Travel Time (hours), Latent Demand (veh), Average Speed (mph))
- Vissim maximum queue for I-95/SR 9 Off-Ramps

Intersection (Synchro) Analysis MOEs:

- LOS
- Delay (seconds per vehicle)
- Maximum volume-to-capacity (v/c) ratio
  (Each intersection movement should have a v/c ratio of 1.0 or less)
- Interchange ramp queue length (feet)
  The 95th percentile queue length in feet, along with any special notes from Synchro, will be reported along with the available storage. The storage available for the turn movements, measured from the stop bar to the taper, will be clearly reported in tables for comparison with the queue length. The *2021 FDOT Design Manual* (FDM) will be referred to for further guidance on measuring storage length for turn lanes. At the off-ramp terminal intersections, the queue length will be reported in tables along with the storage length for the left and right turning lanes. In addition to the turn lane storage, the total ramp length, measured from the stop bar to the gore point with the freeway, will be discussed in the document.

7.0 Safety Analysis

A. Detailed crash data within the study area will be analyzed and documented. The latest five year of crash data shall be used.

Years: 2016, 2017, 2018, 2019 and 2020

Source: State Safety Office GIS (SSOGIS) / CAR Online (The Florida Department of Highway Safety and Motor Vehicles (FLHSMV) data post-processed by FDOT to support safety analyses)

B. Identify the level of safety analysis to be performed, along with any software and tools to be used.

Crash data will be obtained from the FDOT Safety Office for the most recent five-year period on the I-95/SR 9 mainline and its interchanges with SR 860/Miami Gardens Drive and Ives Dairy Road, including the arterial segments within the AOI. The data collected will include the number, type, location, and severity of the crashes. Crash rates along the facility will be compared with the statewide average rates for similar facilities to determine if any “high crash locations” exist within the study area.

The historic crash analysis will be used to inform the quantitative safety analysis of the future year alternatives utilizing Highway Safety Manual procedures. The safety analysis for the proposed conditions will document how the request will impact the facility’s safety within the project study area. The quantitative safety analysis will comply with the guidelines of the *2020 FDOT Interchange Access*

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

Request User's Guide Safety Analysis Guidance to determine the estimated change in the expected number of crashes due to the proposed modifications of the project.

Qualitative safety analysis will only be selected if quantitative safety analysis cannot be performed. If a Crash Modification Factor (CMF) or Safety Performance Function (SPF) is available, a quantitative safety analysis should be performed. Depending on the proposed modification, the Countermeasure CMF methodology or HSM Part C methodology can be selected. If a CMF and SPF are available for the proposed modification, priority should be given to the application of the HSM Part C methodology over the Countermeasure CMF methodology.

8.0 Consistency with Other Plans/Projects

A. *The request will be reviewed for consistency with facility Master Plans, Actions Plans, SIS Plan, MPO Long Range Transportation Plans, Local Government Comprehensive Plans or development applications, etc.*
The Consistency Plan Review will include the following documents:
- FDOT Five-Year Work Program (FY 2022/2026)
- SIS Funding Strategy First Five-Year Plan (FY 2020/2021 through 2024/2025)
- SIS Funding Strategy Second Five-Year Plan (FY 2025/2026 through 2029/2030)
- SIS Long Range CFP (FY 2029/2045)
- Miami-Dade TPO Commitment 2045 LRTP (Adopted 09/26/2019 – Amendment #1 12/19/2019 and Amendment #2 04/23/2020)
- Miami-Dade TPO TIP (FY 2021/2022 through 2025/2026)

B. *Where the request is inconsistent with any plan, steps to bring the plan into consistency will be developed.*

C. *The operational relationship of this request to the other interchanges will be reviewed and documented. The following other IARs are located within the area of influence.*
Coordination will be maintained with the following pertinent projects and studies:
- FM# 436903-1-22-02, I-95/SR 9 Planning Study & PD&E I-95/SR 9 from Miami-Dade/Broward County Line to North of SR-820 (Hollywood Boulevard)
- FM# 439170-1-22-02, PD&E I-95/SR 9 from South of Sheridan Street to Miami-Dade/Broward County Line
- FM# 414964-7, I-95/SR 9 from US 1/South Dixie Highway to South of NW 62nd Street.
- FM# 414964-8, I-95/SR 9 from South of NW 62nd Street to NW 143rd Street
- FM# 414964-9, I-95/SR 9 from NW 143rd Street to South of SR 860/Miami Gardens Drive
- FM# 433511-2, NE 203rd Street Intersection Improvements between SR-5 (US-1) and W Dixie Highway
- I-95/SR 9 Integrated Mobility Options Study
- Snake Creek Trail Underpass – LAP County project
- Golden Glades Interchange Projects FM#'s: 437053-(1 to 5) and 428358 (1, 3 – 5, and 8)

9.0 Environmental Considerations

A. *Status of Environmental Approval and permitting process.*
The project has been determined to be a Categorical Exclusion Type II and is currently expected to be approved on May 10, 2023 (planned date for Location & Design Concept Acceptance). Once approved and funding is secured, the project will enter the Design and Permitting phase. Environmental permits will be applied for at the 60% design plan submittal (date to be determined). All permits are required to be issued prior to Plans Production (100% design plan submittal).

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

B. *Identify the environmental considerations that could influence the outcome of the alternative development and selection process.*

The following environmental considerations are anticipated as part of the Study (which can influence the alternative development and selection process):

Sociocultural effects

- The degree of impacts to adjacent right of way, including the potential for relocations, can significantly influence the selected alternative due to public outcry and cost.
- Avoiding and/or minimizing impacts to potential Section 4(f) resources (Recreational and Cultural) can influence the selective alternative. Five potential Section 4(f) recreational resources exist within close proximity of the project; two of which may be impacted (Milton Littman Park and Snake Creek Trail). Impacts must be minimized to avoid an Individual Section 4(f) use, which can be costly and potentially delay the project's schedule.
- Avoidance and minimization of impacts to cultural and/or archaeological resources will be considered with the selection process. Although not anticipated, significant impacts to cultural/archaeological resources could potentially delay a projects schedule and add additional costs for mitigation.

Natural Resources

- The degree of impact to wetlands and protected species (wildlife and plants) and habitats can influence the outcome of the selected alternative. The project is expected to impact over 30 surface water/drainage features with wetland vegetation in which mitigation may be required.

Physical Resources

- There are 12+ residential neighborhoods and 8+ special use sites along the project corridor which may be impacted as a result of an increase in traffic noise. Existing noise barriers (fanwalls) may also conflict with the engineering design for some of the alternatives and some may need to be modified to address the additional noise concerns. New walls may be proposed at Aventura Isles and possibly Presidential Estates and Coventry/Oak Haven (if reasonable and feasible following completion of the noise study). Minimization off noise impacts will influence the outcome of the selected alternative. Noise complaints from local residents have been received by FDOT from nearby residences in Aventura Isles. Noise concerns will need to be addressed to the greatest extent practicable with the selected alternative.

10.0 Coordination

Yes	No*	N/A*	
☒	☐	☐	An appropriate effort of coordination will be made with appropriate proposed developments in the area.
☒	☐	☐	Request will identify and include (if applicable) a commitment to complete the other non-interchange/non-intersection improvements that are necessary for the interchange/intersection to function as proposed.
☒	☐	☐	Request will document whether the project requires financial or infrastructure commitments from other agencies, organizations, or private entities.

DocuSign Envelope ID: 5C8FBC12-1B81-4D09-A7BF-21132084FBEE

☒	☐	☐	Request will document any pre-condition contingencies required in regards to the timing of other improvements and their inclusion in a TIP/STIP/LRTP prior to the Interstate Access Request approval (final approval of National Environmental Policy Act (NEPA) document).
☒	☐	☐	Request will document the funding and phasing.

**Explain if No or Not Applicable (N/A) is checked*:

11.0 Anticipated Design Exceptions and Variations

☐ *Design exceptions/variations are not anticipated, but if an exception/variation should arise it will be processed per Federal Highway Administration (FHWA) and FDOT standards.*

☒ *The following exceptions/variations to FDOT, American Association of State Highway and Transportation Officials (AASHTO) or FHWA rules, policies, standards, criteria or procedures have been identified:*

- The PD&E Study Scoping Report has identified a potential need for minimum vertical clearance variation.
- Also, the following potential for exceptions/variations have been identified based on a preliminary review of existing conditions, previous concepts, and adjacent projects:
  - Horizontal stopping sight distance related to the tubular markers around horizontal curves
  - Lane width
  - Shoulder width
  - Border width

12.0 Conceptual Signing Plan

A conceptual signing and marking plan shall be prepared and included in the access request. The *Manual on Uniform Traffic Control Devices (MUTCD)* will serve as guidance for preparing the signing plan.

13.0 Access Management Plan

☒ *Access management plan within the area of influence will not be changed by the proposed improvements to the interchange.*

☐ *The improvement will affect the access management within the area of influence that will require a change to the access management plan. An access management plan will be developed within the area of influence to complement the improvements to the interchange.*

14.0 FHWA Policy Points

The two FHWA policy points will be addressed within the access request.

A FULL GUIDE TO THE TRANSPORTATION IMPROVEMENT PROGRAM (TIP)

Miami-Dade Transportation Planning Organization

SR 9A/I-95 FROM SOUTH OF MIAMI GARDENS DRIVE TO NORTH OF BROWARD COUNTY LINE

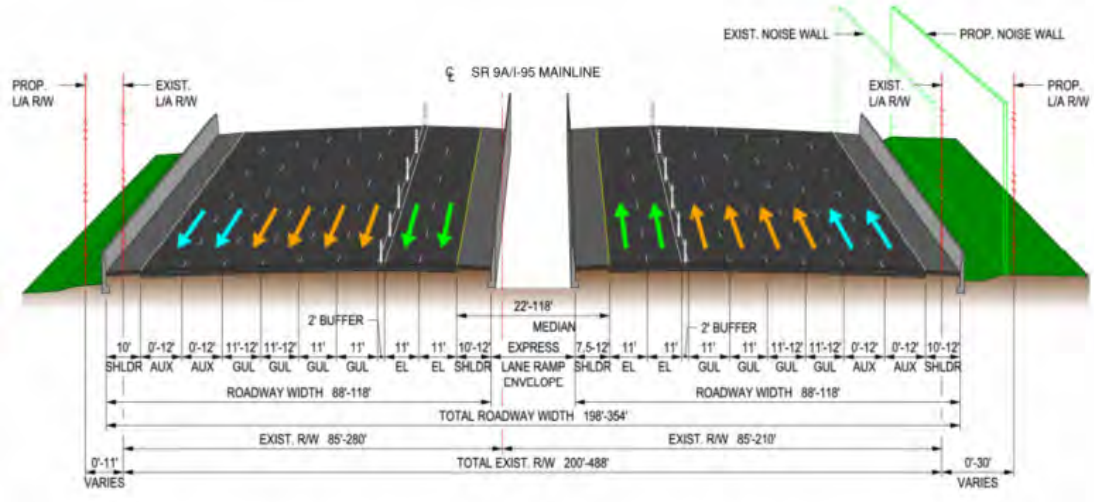
I-95/SR 9 PD&E STUDY

The PD&E study for SR 9A/I-95 from Miami Gardens Drive to the north of Broward County Line will evaluate potentially providing additional express and/or general use lanes on SR 9A/I-95 from south of SR 860/Miami Gardens Drive to the north of Broward County Line and implementing interchange improvements at SR 860/Miami Gardens Drive and CR 854/ Ives Dairy Road within Miami-Dade County. The following benefits are included in this project:

Overall, the project will offer enhanced mobility options for motorists and transit users as it will provide additional capacity along the SR 9A/I-95 corridor throughout northern Miami-Dade County. Consistent with the existing managed lanes system on SR 9A/I-95, the additional express lanes are anticipated to operate using variable toll pricing based on congestion to optimize traffic flow.

The PD&E study has the following project objectives:

- Address the deficient operational capacity and relieve existing/future congestion along the SR 9A/I-95 corridor.
- Preserve the operational integrity and regional functionality of SR 9A/I-95 (and, therefore, the regional transportation network) by complementing similar corridor improvements throughout Miami-Dade, Broward, and Palm Beach Counties.
- TeamGEnhance emergency evacuation and response times.



I-95/SR 9A I-95/SR 9A Mainline and Express Lanes Proposed Typical Section

The PD&E is estimated to be completed by December 2025.

For information related to the project, visit: https://www.fdotmiamidade.com/i95northPDE.html

LEGEND

(A) FY 2034/2035 - 2039/2040	(A) 1.561
(B) FY 2040/2041 - 2044/2045	(B) 1.784
(C) FY 2045/2046 - 2049/2050	(C) 2.098
Mega Projects Phased Over Time	Inflation Factors

NOTES

(1) All values in thousands of Year of Expenditure dollars to the midpoint of year bands.
(2) All phase costs shown as supplied by each District.
(3) CON includes both Construction (CON52) and Construction Support (CEI).
(4) ROW includes both Right-of-Way Acquisition/Mitigation (ROW43/45) and Right-of-Way Support.
(5) "P3 Funds" - Used to fund Public-Private Partnership projects over a specified number of years.
(6) Revenue forecast provides separate values for PDE and PE than for ROW and CON.

IMPROVEMENT TYPES

A1-3: Add 1 Lane to Build 3
A2-4: Add 2 Lanes to Build 4
A2-6: Add 2 Lanes to Build 6
A2-8: Add 2 Lanes to Build 8
A2-10: Add 2 Lanes to Build 10
A4-6: Add 4 Lanes to Build 6
A4-8: Add 4 Lanes to Build 8
A4-10: Add 4 Lanes to Build 10
A4-12: Add 4 Lanes to Build 12
A1-AUX: Add 1 Auxilliary Lane
A2-AUX: Add 2 Auxilliary Lanes
A2-SUL: Add 2 Special Use Lanes
A4-SUL: Add 4 Special Use Lanes
A2-MGL: Add 2 Managed Lanes
ACCESS: Access Change
BRIDGE: New / Modify Bridge
FRTCAP: Freight Capacity
GRASEP: Grade Separation
HWYCAP: Highway Capacity
ITS: Intelligent Transp. System
MGLANE: Managed Lanes
M-INCH: Modify Interchange
M-INT: Modify Intersection
N-INCH: New Interchange
NR: New Road
PDE: Project Dev. and Env.
PTERM: Passenger Terminal
SERVE: Add Svc/Front/CD System
STUDY/PLAN: Planning Study
TRUKPK: Truck Parking
TURN: Add Turn Lane
UP: Ultimate Plan

SIGNALIZATION NOTES

1. CONTRACTOR TO USE EXISTING CONDUITS AND PULL BOXES TO RUN NEW LOOP HOME-RUN CABLE AND SIGNAL CABLE TO EXISTING CONTROLLER CABINET
2. MAJOR STREET IS IVES DAIRY RD (EASTBOUND & WESTBOUND) MINOR STREET IS I-95 RAMP (SOUTHBOUND)
3. CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE EXISTING CONDUITS, PULL BOXES, NEW CONDUIT ENTRY INTO EXISTING CABINET FOR LOOP REPLACEMENT AND PEDESTRIAN SIGNALS INSTALLATION.
4. PROTECTED ONLY LEFT TURN FOR MOVEMENT 5
5. FLASHING OPERATION TO BE YELLOW FOR IVES DAIRY ROAD AND RED FOR I-95 RAMP AND WESTBOUND LEFT-TURN
6. INTERSECTION RE-WIRE SHALL BE PAID FOR UNDER PAY ITEM NUMBER:
   632-7-1 1 PI
7. PAY ITEM NO. 690-100 INCLUDES REMOVAL OF ABANDONED PULL BOXES AND EXISTING LOOP LEAD-INS.
8. NEW SIGNAL HEADS ON EXISTING MAST ARMS SHALL NOT INCLUDE SIGNAL BACKPLATES.
9. CONTROLLER TIMINGS TO BE PROVIDED BY MIAMI-DADE COUNTY.
10. STEEL LINE LOCATED UNDER PROPOSED MAST ARM 1 IS NO LONGER IN SERVICE.
11. INSTALL ADDITIONAL LOOP DETECTOR IN CABINET IF NECESSARY.
12. LOCATION OF AT&T SERVICE POINT AND POWER SERVICE POINT TO BE PROVIDED IN THE AS-BUILT PLANS.

1.0 INTRODUCTION

This Vissim calibration memorandum is being prepared as part of the Project Development & Environment (PD&E) to address the proposed improvements at the SR 9/I-95 corridor from south of SR 860/Miami Gardens Drive (MP 13.724) to north of Broward County Line (MP 17.199), in Miami-Dade County, Florida. This memorandum documents the Vissim microsimulation model development, calibration, and validation for the existing 2021 AM and PM peak period conditions.

The Vissim model contains the I-95 corridor including express and general-use lanes from south of Miami Gardens Drive Interchange (MP 13.724) to Broward County Line (MP 17.199), in Miami-Dade County, Florida. **Exhibit 1** shows the project location and **Exhibit 2** shows the study limits of the Vissim model.

The calibrated existing conditions model will be used as the base model in evaluating the proposed improvements and modifications for future conditions.

1.1 Software Selection

The calibrated model was created using Vissim (Version 2023, Service Package 05) software. Vissim is a microscopic traffic flow simulation model based on car following, lane change, and queuing logic. Vissim does not follow the conventional link/node modeling system but utilizes a link/connector system that enables complex geometry to be modeled. The link/connector system also permits different traffic controls to be utilized anywhere in the model. Vissim can model vehicles, transit, and pedestrians under unique schemes of lane configuration, traffic composition, and signal traffic controllers. Its flexibility allows selecting between different types of traffic demand modeling: Static Routing based on traffic turning movement data or Dynamic Traffic Assignment (DTA) using origin-destination matrices. Vissim has the ability to model Managed Lanes (MLs), High Occupancy Vehicle (HOV) lanes, and other transportation strategies that are being implemented within the state. Vissim models each individual vehicle within the network in order to determine the measures of effectiveness (MOEs) for freeways, ramps, and intersections.

Exhibit 1: Project Location Map

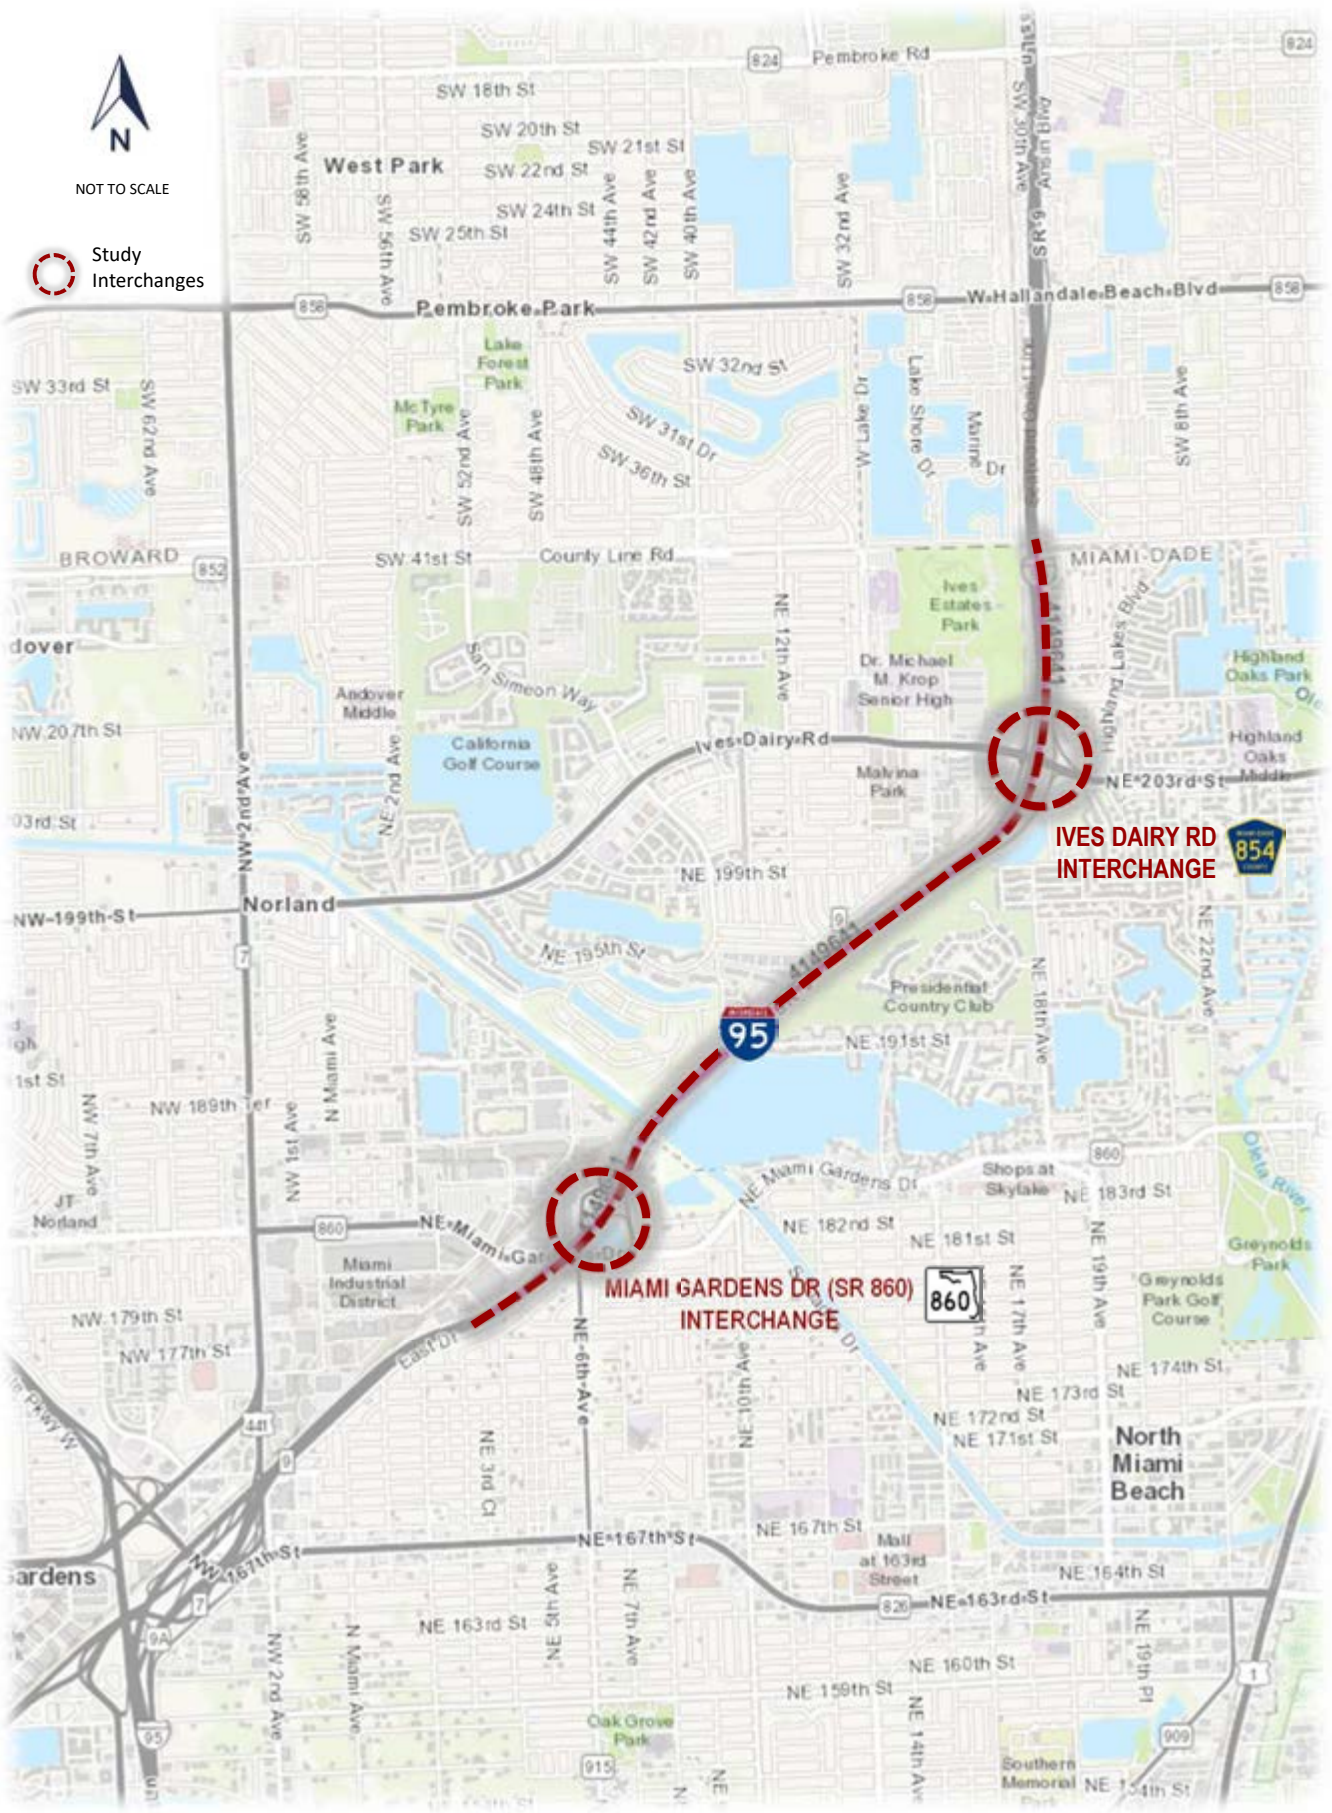

Exhibit 2: Study Limits

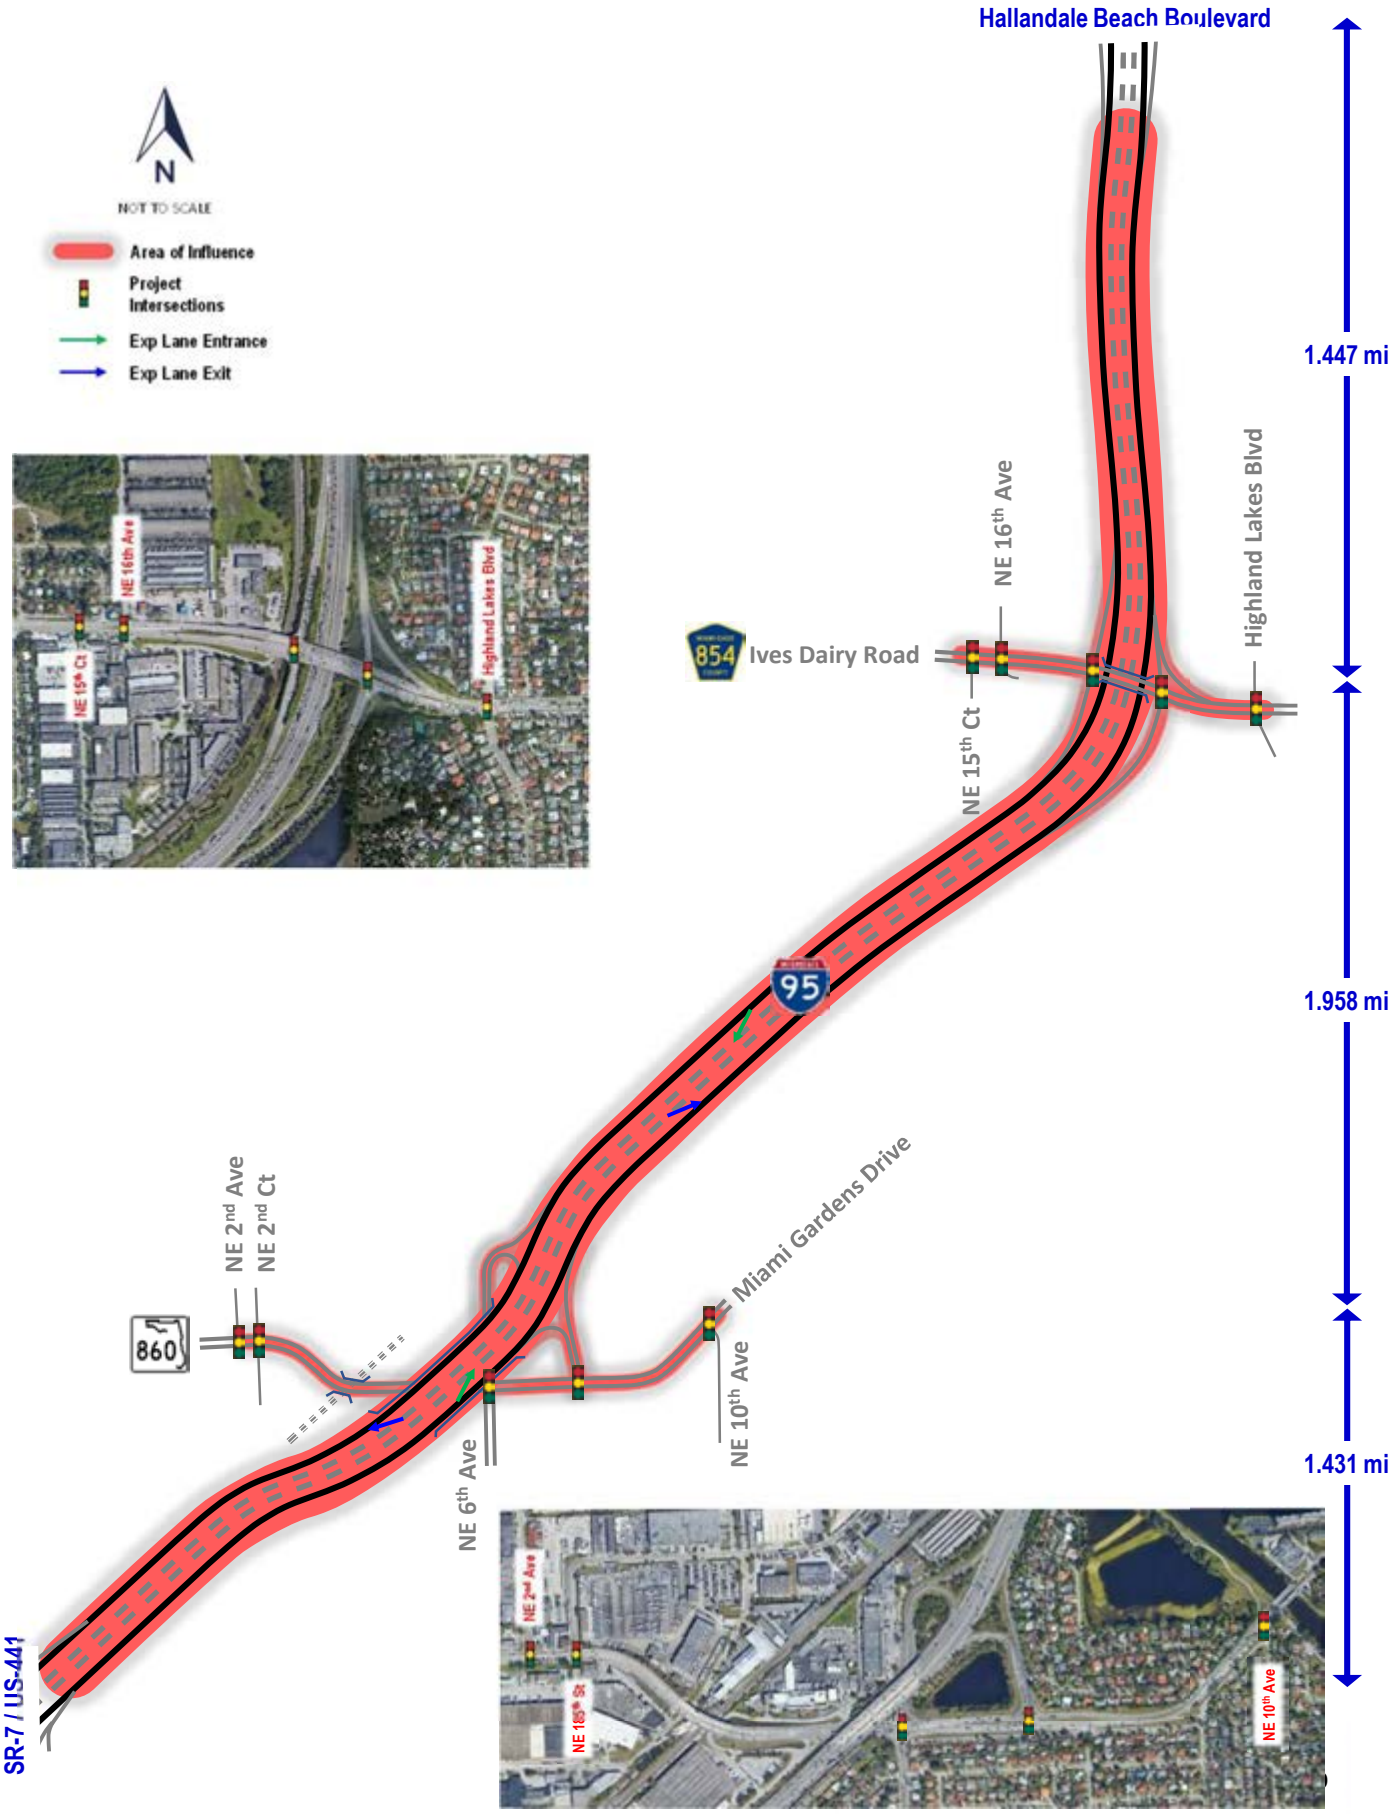


2.0 VISSIM MODEL DEVELOPMENT

This section contains details on the inputs used to develop the Vissim model for existing conditions. The Vissim model was developed consistent with the latest FDOT guidelines - *2021 FDOT Traffic Analysis Handbook.* Model development and parameter adjustments were performed using the latest techniques and best engineering practices.

2.1 Existing Traffic Volumes

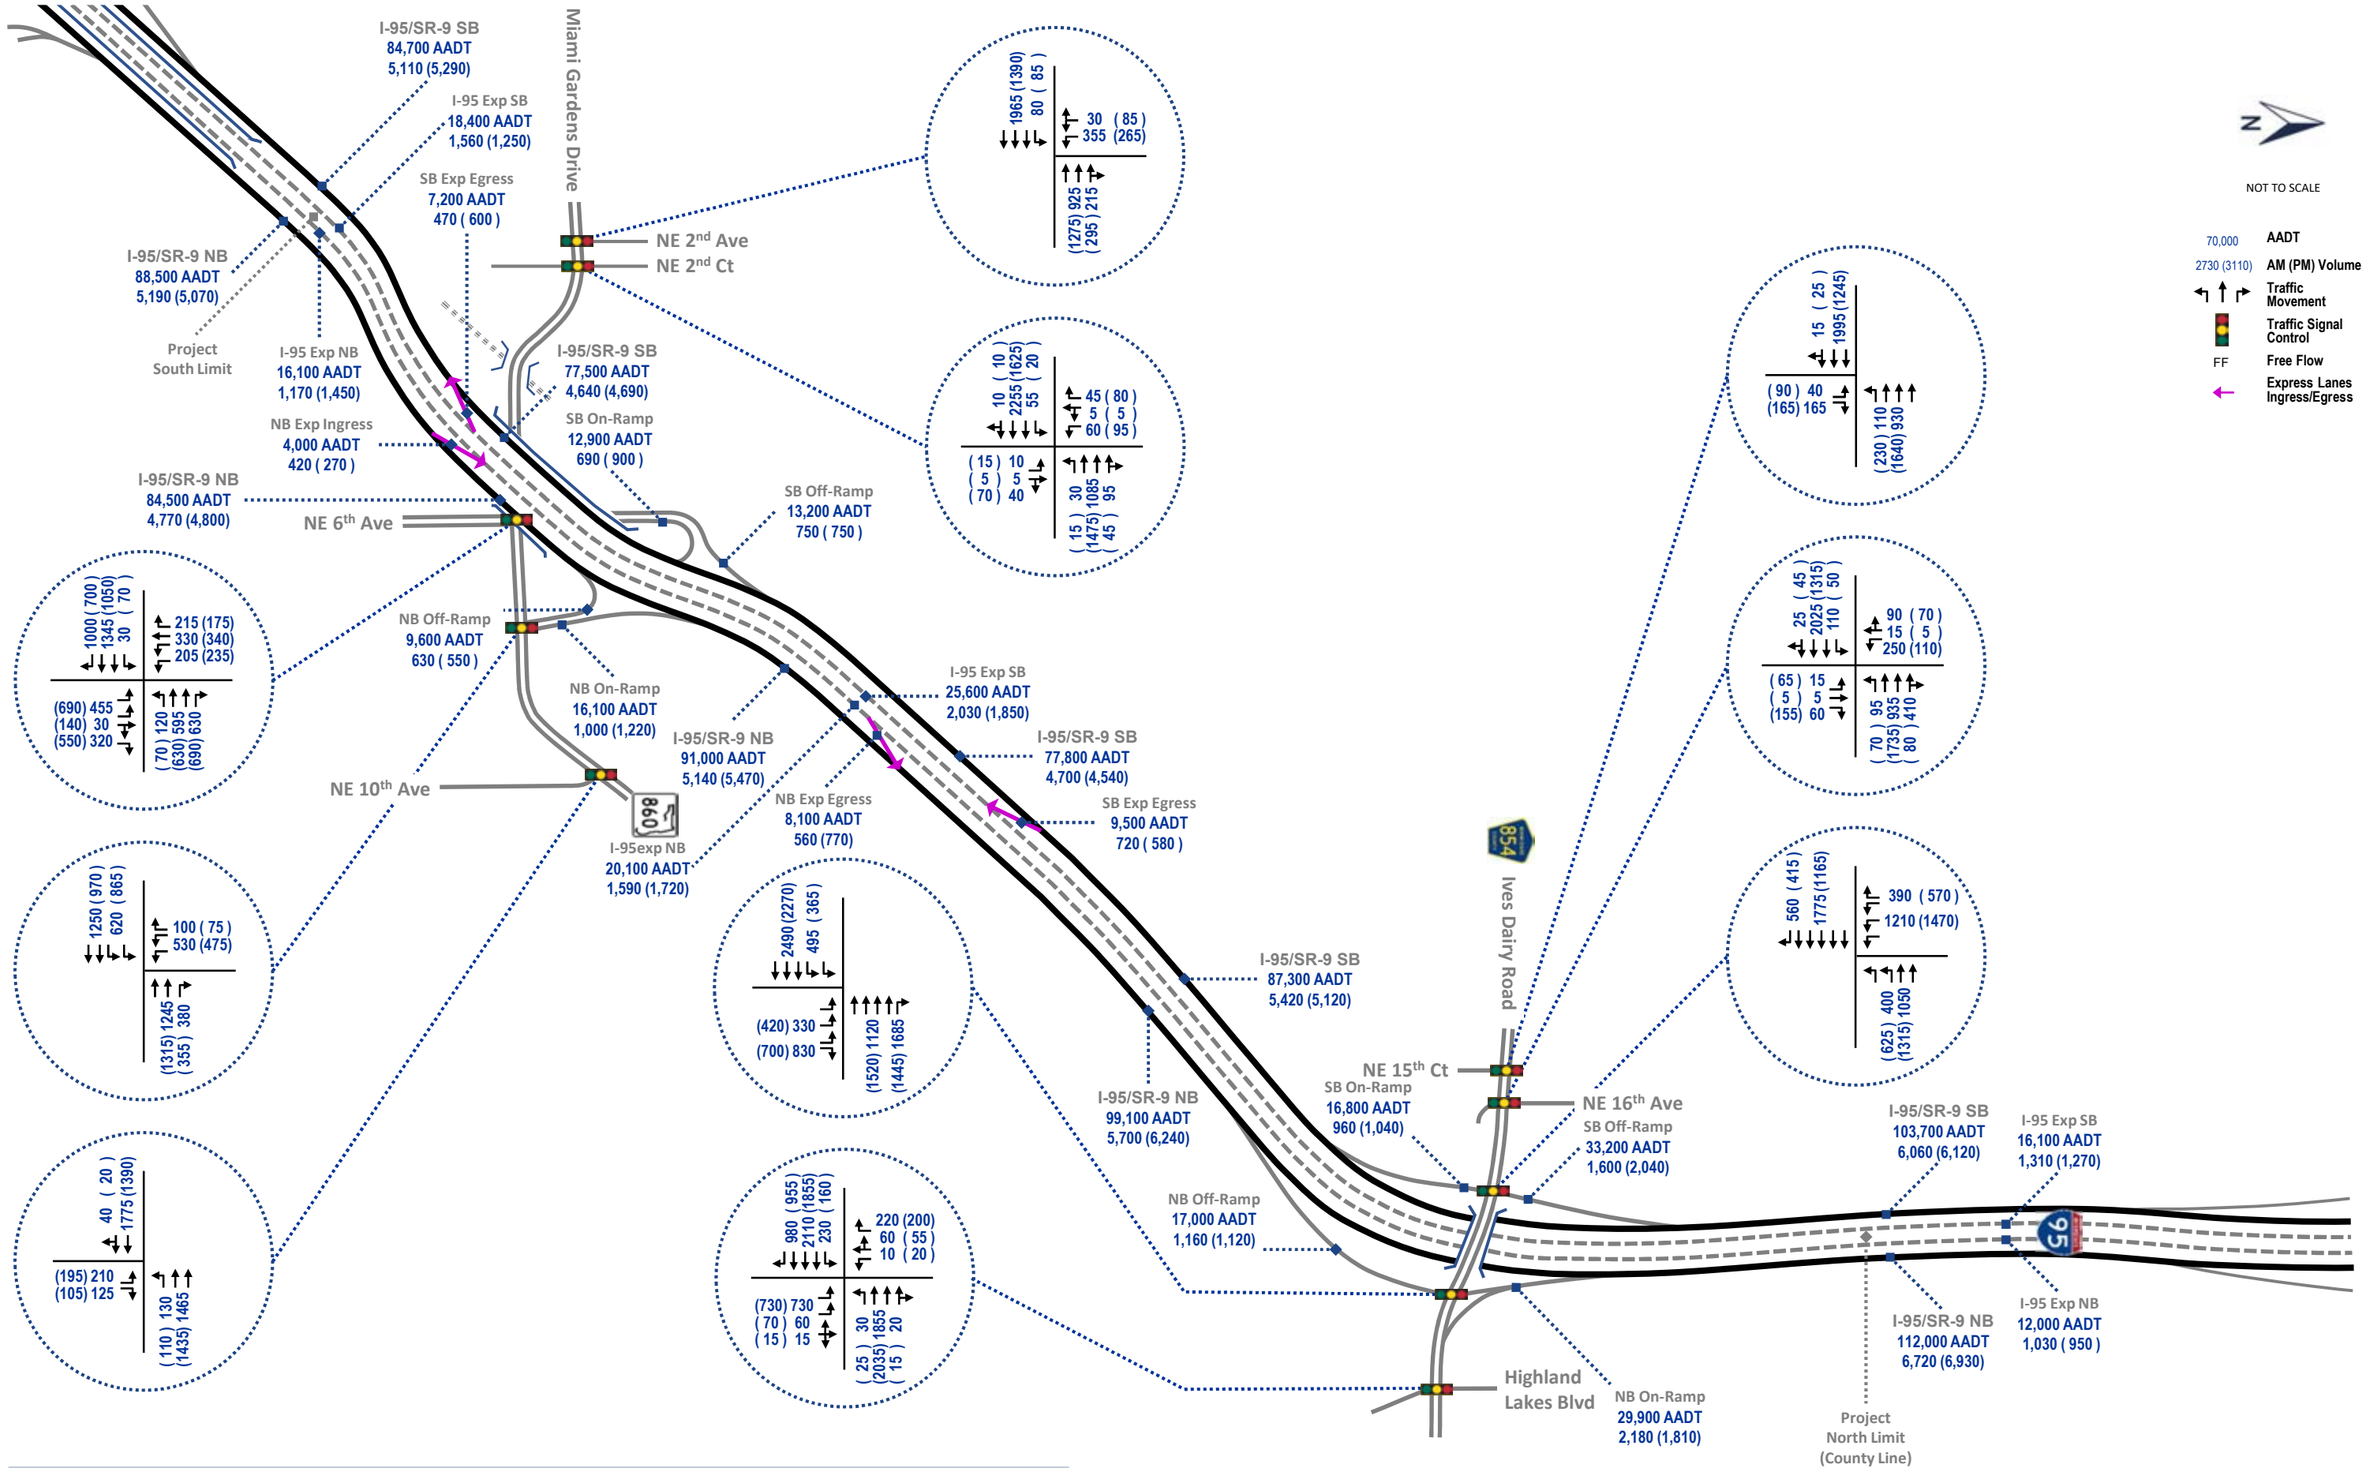
I-95 Mainline 72-hour bi-directional vehicle volumes and speeds in 15-minute intervals were obtained from RITIS from Tuesday, September 21, 2021 to Thursday, September 23, 2021, which corresponded with the volume data provided by the Department for the SR 860/Miami Gardens Drive and CR 854/Ives Dairy Road cross roads). Based on a review of the three days of data, Tuesday, September 21, 2021 was selected to represent typical recurring congestion conditions to be used in this PD&E analysis. The other two days of data indicate that an incident occurred with significant impact on volumes and speeds. It is important to focus calibration on a single observed day since that day can be characterized in a microsimulation model with specific performance data. Since the Volume and Speed data from RITIS for Wednesday, September 22, 2021 and Thursday, September 23, 2021 were found to be significantly different from Tuesday, September 21, 2021, three additional days reflecting typical recurring congestion conditions were extracted from the RITIS data. The additional data review indicates that July 15, 2021, July 27, 2021, and September 14, 2021 (among others) present comparable days to Tuesday, September 21, 2021 all of which indicate that the models represent typical recurring congestion conditions (i.e., free of significant incidents).

I-95 count data was supplemented with counts from regular FDOT count stations from the Florida Traffic Online (FTO) database. Arterial/Ramp 72-hour bi-directional vehicle volumes and classification in 15-minute intervals were provided by the Department for same period (from Tuesday, September 21, 2021 to Thursday, September 23, 2021). Turning movement counts (TMCs) were provided by the Department. TMCs were collected on Thursday, September 23, 2021 from 6:30 a.m. to 9:30 a.m. and from 3:30 p.m. to 6:30 p.m.

Exhibit 3 summarizes the 2021 AM and PM peak hour volumes as well as the current lane geometry. A comparison of the 2021 balanced AADT volumes versus the FTO 2019 data entering the network was conducted to assess covid impacts. The comparison indicates that the total 2021 AADTs entering the network are approximately 3% higher than the total 2019 AADTs entering the network. Therefore, the potential impacts from COVID 19 were considered negligible. Bicyclist and pedestrian activities are not frequent at intersections and were not coded in the Vissim model. **Attachment A** presents existing RITIS traffic volume and speed data.

Traffic signal timing information was obtained from the Miami-Dade County Traffic Signals and Signs Division (TS&S) and field checks. To match the provided cycle lengths, yellow and all-red intervals were rounded to eliminate decimal numbers. Built-in Bing maps aerial imagery of Vissim was used to identify intersection layout, verify channelized and free-flow movements, and measure the length of the left and right turn storage bays. **Attachment B** presents the traffic signal timing information from the Miami-Dade County Traffic Signals and Signs Division (TS&S).

Exhibit 3: Existing Year 2021 Peak Hour Traffic Volumes



2.2 Vehicle Models and Distributions

The North America Vehicle Models and Distributions developed by PTV America were adopted in this study. PTV America selected models for cars and developed the distributions based on car sales data. The North America model distribution for cars is shown in **Exhibit 4**.

2.3 Speed Distributions

Desired speeds and distributions were developed based on posted speed limits. The posted speed limits collected in the field are listed in **Exhibit 6.**

Exhibit 6: Posted Speed Limits

Facility	Posted Speed (mph)
Miami Gardens Drive/west of NE 8th Avenue	40
Miami Gardens Drive/east of NE 8th Avenue	30
Ives Dairy Road	40
I-95 GP and EL (Miami Dade County)	55
I-95 GP and EL (Broward County)	65
School Zone on Ives Dairy Road	15

Note that based on the HERE/RITIS database, drivers on express lanes systematically drive significantly over the posted speed limits. A detailed discussion can be found in Section 4.2, Spot Speeds, of the Vissim Calibration Memorandum. The driving speeds on express lanes in Miami-Dade County in the Vissim model were elevated by 5 mph to more accurately reflect the actual speeds observed in the field. The speed distributions shown in **Exhibit 7** were used. All speed distributions assumed an 85th percentile speed of 5 mph higher than the posted speed. The upper speed distribution limit was set to be 10 mph greater than the posted speed and the lower limit 5 mph lower than the posted speed. Upper speed represents free flow conditions. Trucks were modeled at a 5 mph lower speed than cars. Loop ramps were modeled with reduced speed areas based on design speed. For interchange ramps, the segment closest to the freeway mainline was modeled with the corresponding mainline speed. Distributions for reduced speed areas were also developed for left turn movements, right turn movements, and free or channelized right turns. In addition, reduced speed areas were coded in the Vissim model to reflect the school zone posted speed limit of 15 along Ives Dairy Road and congested segments outside the study area. These segments include SB I-95 just north of the Golden Glades Interchange (GGI) and segments along Ives Dairy Road to the east and west sides of the interchange on the EB and WB directions.

Exhibit 7: Speeds Distribution Thresholds

Facility or Function Type	Posted Speed (mph)	Lower Limit	15% Percentile	85% Percentile	Upper Limit
Freeway Mainline (GP and EL)	65	60	65	70	75
	60	55	60	65	70
Arterials	40	35	40	45	50

Right Turn Movement*	n/a	8	10	12.5	15
Free or Channelized Right Turn*	n/a	15	20	22.5	25

*:Reduced Speed Area

2.4 Traffic Composition

Design Hour Truck (DHT) values were calculated based on historical data from the FDOT count sites within the study area, mechanical classification counts and turning movement counts conducted by the Department as part of the data collection efforts. DHT values from mechanical counts were calculated as half the daily value in accordance with the *FDOT Project Traffic Forecasting Handbook*. The calculated DHT values of 3% for I-95 and 2% for Miami Gardens Drive and Ives Dairy Road were used based on existing and historical data. The composition of traffic (i.e., car and truck percentages) at entry links are listed in **Exhibit 8.**

Exhibit 8: Truck Percentages

Road	T peak hour (1)
I-95 General-Use Lanes	3
I-95 Express Lanes	0
Miam Gardens Drive	2
Ives Dairy Road	2

T peak hour: Peak hour truck percentage

In the Vissim model, the peak hour truck percentage is rounded to 2% for other local roads.

2.5 Vehicle Inputs

A four-hour analysis period was selected to ensure that traffic operations were accurately modeled. The four-hour analysis period provided adequate time for congestion build-up and dissipation. The counter site 872485 (SR 9A/I-95, 200' S. Miami-Dade/Broward Co. Line, Northbound) with a synopsis report was selected as a typical location to reflect the volume distribution at 15-minute intervals throughout the peak period. As such, the factors shown in **Exhibit 9** were developed using the synopsis report at counter site 872485 in the range of June 29th (Tuesday) and July 1st (Thursday), 2021 to distribute traffic throughout the peak period. A 30-minute seeding period was coded. The second hour represented the peak hour. Traffic volumes were entered in 15-minute increments as exact values. **Attachment C** presents traffic volume data from FDOT counter site 872485.

Exhibit 9: Peak Period Vehicle Input Distributions

Hour	AM Period			PM Period		
	Time Interval	Hourly Proportion[1]	Distribution	Time Interval	Hourly Proportion[1]	Distribution

	10:30		21.99%	6:45		23.68%

[1]Percent of peak hour

2.6 Other Critical Input Variables

Static vehicle routes were coded in the model with the feature of "Combine Routes" selected in order to provide ample distance/time for drivers to position in the correct lane. Static routing decisions were also used for Express Lane facilities, this was done due to a fixed Express Lane demand since different toll pricing models will not be analyzed and time savings outside the study area would have to be included otherwise. These routes were adjusted to only allow passenger cars on the facility. The entry links for freeway mainline were extended to over one and a half miles and arterials to over half a mile to provide adequate distance for lane change maneuvers and ensure that all traffic demand entered the network.

Stop signs and signal heads were coded in the model consistent with field conditions. Signal timings in the model were coded to be consistent with signal timing plans obtained from Miami Dade County.

Conflict marks were coded for movements with potential conflicts such as a right-turn movement with a conflicting through movement and a left-turn movement during permitted phases with an opposing through movement. Priority rules were coded to prevent queues from blocking the intersection.

2.7 Review of Inputs and Animation

The model was checked to identify and correct coding errors. Inputs were reviewed as follows:

1. Link and connectors' geometry, lengths, number of lanes, and speeds were checked.
2. Priority rules, conflict areas, reduced speed areas, and stop signs were verified.
3. Driving behavior types were verified for the freeway, ramps, and arterials.
4. Vehicle proportions at each entry point were checked.
5. Turn proportions at intersections were checked.
6. Traffic simulation was observed several times to assess the reasonableness of the microsimulation model and lane utilization issues.
7. Counterintuitive results were also checked. For example, delays were reported at some free flow channelized right turn movements, but queues were not observed. This was explained as delays due to the through traffic moderate to severe congestion blocking right-turning vehicles upstream the right turn bay lanes.

3.0 VISSIM MODEL CALIBRATION

Calibration of the base microsimulation model was achieved by adjusting model parameters to improve the model's ability to replicate field driver behavior and traffic flow patterns. Calibration of the model was based on traffic volumes, simulated speeds, and field observations of traffic conditions.

3.1 Calibration Criteria

The Vissim model was calibrated in accordance with the latest FDOT guidelines: *2021 FDOT Traffic Analysis Handbook.* These criteria are presented in **Exhibit 10** and were applied in this study.

Exhibit 10: Freeway Model Calibration Criteria

Criteria and Measures	Calibration Acceptance Targets
Hourly Flows, Model Versus Observed	
Individual Link Flows	
Within 100 veh/h, for Flow < 700 veh/h	> 85% of cases
Within 15%, for 700 veh/h < Flow < 2700 veh/h	> 85% of cases
Within 400 veh/h, for Flow > 2700 veh/h	> 85% of cases
Sum of All Link Flows	Within 5% of sum of all link counts
GEH Statistic < 5 for Individual Link Flows	> 85% of cases
GEH Statistic for Sum of All Link Flows	GEH < 5 for sum of all link counts
Speed	Modeled average link speeds to be within the ±10 mph of field-measured speeds on at least 85% of all network links.
Visual Audits	Check consistency with field conditions of the following: on- and off-ramp queuing; weaving maneuvers; patterns and extent of queue at intersection and congested links; lane utilization/choice; location of bottlenecks

The Geoffrey E. Havers (GEH) Statistic is a measure for comparing modeled and observed volumes, which overcomes the inconsistencies inherent in comparing a wide range of volumes. The GEH is computed as follows:

$$GEH = \sqrt{\frac{2(M-C)^2}{M+C}}$$

Where:

M: simulated traffic volume

C: observed count

A comparison of modeled and field observed congestion and queues was performed at select locations to ensure proper operation of intersections. It should be noted that a quantitative comparison of model and real-world queues is not typically required unless otherwise dictated by project requirements or requested by the agency staff.

3.2 Required Number of Simulation Runs

Due to the stochastic nature of microsimulation models, the results from individual runs can vary and may have higher standard deviations for facilities operating at or near capacity. Thus, it is necessary to perform multiple runs with different random seeds to gain an accurate reflection of the performance of the model. Vissim has a multiple run capability where the user can specify the initial random seed number, number of runs, and increments for the random seed in each of the multiple runs. The number of required runs was computed using the following formula:

$$N = \left(t_{0.025,N-1} \frac{S}{R} \right)^2$$

Where:

N: Number of required simulation runs

$t_{0.025, N-1}$: Student's t-statistic for two-sided error of 2.5 percent (totals 5 percent)

with N-1 degrees of freedom

S: Standard deviation about the mean for selected measure of effectiveness

R: 95 percent confidence interval for the true mean

An initial data set was generated using 3 random number seeds to compute the required number of runs. The random number seeds for the initial run are 10, 30, and 45. Simulated speeds on the I-95 general-use lanes, northbound link, located between the interchanges of Miami Gardens Drive and Ives Dairy Road, derived from the existing AM/PM peak period model were used as the measure of effectiveness to compute the standard deviation.

A 95 percent confidence level was assumed. The number of required runs was then computed iteratively using the Student t-statistic until convergence, i.e., the assumed number of runs equaled the required number of runs. As displayed in **Exhibits 11** and **12,** the calculated required number of Vissim model runs is 9 runs. However, in this project the Vissim model was run ten (10) times to be conservative with a simulation resolution of 10 time steps per simulation second.

Exhibit 11: Estimating Required Number of Vissim Model Run (AM)

Measure of Effectiveness	Initial Model Runs			Standard Deviation (S)	Desired Confidence Interval (CI)	Runs (N)	Iteration	
	Seed Number 10	Seed Number 30	Seed Number 45				t (1-alpha/2), N-1	Number of runs (N)

Vissim Link 109 from Existing PM model

3.3 Driving Behavior Calibration

The factors that define driving behavior in Vissim are generally classified as car following and lane change parameters. The network model was calibrated by changing the default values for a few of these parameters, as shown in **Exhibit 13**.

Freeway car following equations are mainly based on Wiedemann 99 model, which is a function of 10 parameters (CC0 to CC9). The headway time (CC1) parameter has the largest impact on capacity as it affects the saturation flow rate.

Car following behavior for arterials is defined using the Wiedemann 74 model. The "additive part of safety distance" and "multiplicative part of safety distance" parameters have the highest impact on Capacity. The basic arterial parameters were calibrated to an ideal saturation flow rate of about 1,900 passenger cars per mile per lane pcphpl, per the *Highway Capacity Manual (HCM)*. The ideal flow rate is inherently reduced to an actual flow in the network model depending on vehicle interactions, signal control, intersection geometry, truck proportion, proximity of adjacent intersections, etc. In this project, arterials were coded with the basic arterial parameters.

Exhibit 13: Adjusted Driving Behavior Parameters

Facility Type	Parameter Type	Driving Behavior Parameters	Units	Default Values	Freeway Basic	Freeway Merge/Diverge	Freeway Aggressive On-Ramp	Freeway Weave	Express Lanes Basic	Express Lanes Merge/ Diverge	Express Lanes Weave	Freeway Weave North of Ives Dairy Road	Express Lanes Weave Southbound	Arterial Basic	Arterial Saturated	Arterial Southbound Off-Ramp	Suggested Range*

*: Derived from *2021 FDOT Traffic Analysis Handbook*

**: x.xx/x.xx: AM/PM

The lane change parameters with a major impact on traffic flow are the “waiting time before diffusion” and “cooperative lane change” for freeway basic segments, merge diverge areas, and weaving areas. The former was increased from 60 to 180 seconds considering the long cycle length in the network to reduce the number of vehicles removed from the network. The later was enabled to improve vehicle interactions during lane change maneuvers.

Freeway and arterial traffic simulation in Vissim is also significantly affected by the emergency stop and lane change distances for connectors. The default values of 16.4 feet for emergency stop and 656.2 feet for lane change distance are too short to provide the appropriate number of lane changes, especially at freeway merge/diverge areas and for intersection turn lanes. The default distances were changed to 50 feet and 1,320 feet for emergency stop and lane change, respectively, on all connectors to model travel behavior more accurately. The emergency stop distance of 50 feet was changed in some cases like for turn lanes to align traffic and prevent unrealistic behavior patterns like lane change maneuvers close to stop bar. The lane change distance was increased or decreased in multiples of 0.25 miles (1,320 feet) at select locations to arrive at realistic traffic flow patterns.

4.0 CALIBRATION OUTPUT

Calibration of the model was based on traffic volumes at I-95 segments and major intersections, spot speeds along I-95, and visual observations of queues at select critical locations to ensure that it accurately represented field conditions. Calibration results for the morning and afternoon peak hours are presented in the following sections. The calibration results of the full simulation period of 4 hours, which includes pre-peak and post-peak recovery hours, are included in the attachments of this document.

4.1 Traffic Volume Calibration

Exhibit 14 displays network-wide statistics for the year 2021 during AM and PM peak periods, derived from Vissim simulation results. Almost all the traffic demand has been processed in the model.

Exhibit 14: Year 2021 AM and PM Peak Period Network-wide Statistics

Statistics	Year 2021	
	AM Peak Period	PM Peak Period
Total travel time [hour], All Vehicle Types	11,358	10,858
Total delay time [hour], All Vehicle Types	3,863	3,393
Average delay time[second], All Vehicle Types	150	135
Average speed [mph], All Vehicle Types	35	36
Percent demand served	99%	100%

A calibration summary of volume (link flows) along I-95 during peak hours is presented in **Exhibits 15** and **16**, as per the calibration criteria. Traffic volumes for I-95 segments in Vissim were obtained from link evaluation output files. Evaluations were based on the average of 10 model runs to be conservative. **Attachment D** presents the I-95 traffic volume calibration results of the full simulation period of 4 hours.

As displayed in **Exhibit 16**, during the year 2021 PM peak hour, all the twenty-two segments (100%) and the sum of all the I-95 segments satisfy volume calibration targets.

A volume calibration summary of individual movements of intersections along Miami Gardens Drive and Ives Dairy Road is presented in **Exhibits 17** and **18**, as per the calibration criteria. Traffic volumes of individual movements of intersections were obtained from node evaluation output files. **Attachment E** presents the intersection traffic volume calibration results of the full simulation period of 4 hours.

As displayed in **Exhibit 17**, during the year 2021 PM peak hour, 40 out of 42(95%) of individual movements of all the intersections satisfy volume calibration targets.

4.2 Spot Speeds

The model was calibrated using speed data obtained from HERE/RITIS (HERE Global B.V. is a company that provides mapping and location data). This data was used for the AM and PM peak hours along I-95 general-use lanes and express lanes. The simulated speeds, derived from data collection points, were compared against the speed data obtained from the HERE/RITIS database.

Exhibit 19 lists the percentages of locations that satisfy the calibration target, assuming the spot speeds at northbound express lanes are capped at 65 MPH, which is 15 MPH higher than the posted speed limit. The calibration threshold of 85% is achieved for all four hours during both the AM and PM peak periods. Therefore, the model meets the calibration target for spot speeds during both the AM and PM peak periods.

Exhibit 19: Satisfaction Rate of Speed Calibration

Hour	AM	PM
1st	96%	88%
2nd	89%	92%
3rd	96%	88%
4th	88%	96%

Exhibits 20 and **21**, next page, present comparative results for each individual spot during the peak hour (2nd hour) and shoulder hours, and they indicate adequate calibration. **Attachment F** presents the spot speed calibration results for the full simulation period of 4 hours.

During the AM peak hour (2nd hour), the calibration results of spot speed show that 20 out of 26 spots (76.9%) satisfy the calibration target but do not meet the calibration threshold of 85%. This is due to drivers traveling northbound on the express lane, through Locations 2, 3 and 4, at 15 MPH, or more, over the posted speed limit of 55 MPH. If the average spot speed at these three locations was 65 MPH (10 MPH over the posted speed limit), the satisfaction rate would increase to 88.5%, enough to satisfy the calibration acceptance threshold of 85%. In addition, the calibration parameters were maintained to obtain a balance between the volume and spot speed calibration criteria for the full simulation period of 4 hours. During the PM peak hour (2nd hour), 24 out of 26 spots (92.3%) satisfy the calibration threshold of 85 %.

Location 7 – Between Express Lanes Ingress/Egress and Miami Gardens Drive (FLD6DOT095SB015.1)

4.3 Visual Observations

According to field observations, during the AM peak hours, the freeway segment of I-95 southbound general-use lanes from the Miami Gardens Drive on-ramp to the Golden Glades interchange experiences heavy congestion. The major cause for the delays is congestion from the Golden Glades Interchange and the substantial number of vehicles weaving along I-95 to maintain a southbound direction to the Golden Glades interchange and a two-sided weaving from express lanes to the Golden Glades interchange. The Vissim simulations corroborate with field observations. As displayed in Exhibit 15, the simulated speed drops to 39 MPH where it approaches the Golden Glades interchange.

Similarly, I-95 southbound express lanes are also experiencing heavy congestion from the ingress point after the Ives Diary interchange to the Golden Glades interchange during the AM peak hours. The major cause for the delays is southbound operations from the Golden Glades interchange, outside of the study area. The Vissim simulations corroborate with field observations. As displayed in Exhibit 15, the simulated speed drops to 43 MPH where it approaches the Golden Glades interchange.

The Vissim intersection analysis results indicate that the I-95 NB ramp terminal intersection at Ives Dairy Road and the I-95 NB ramp terminal intersection at Miami Gardens Drive operate at LOS D or better. The immediate adjacent intersection of Ives Dairy Road at Highland Lakes Boulevard, the I-95 SB ramp terminal intersection at Ives Dairy Road and the I-95 SB ramp terminal intersection at Miami Gardens Drive operate at LOS F during one or both peak hours. In addition, there are several movements that operate at LOS E and F, and queuing exceeds available storage. Field observations support the analysis results.

According to the RITIS database, field speeds along the I-95 southbound general-use lanes between Ives Dairy Road and Hallandale Beach Boulevard are noticeably low (41 mph during the AM peak and 24 mph during the PM peak). To replicate these low speeds and field observations, driving behavior parameters along this segment were adjusted to produce congestion and replicate substantial lane-changing activities, thereby visually demonstrating a queue in the simulation.

During field observations, it was noted that queues for several movements extended substantially, often exceeding 25 vehicles. Vehicular queues occasionally extended beyond intersections and the I-95 gore areas. Once vehicular queues extended beyond the gore area, it was no longer possible to differentiate off-ramp traffic from mainline traffic. Vehicular queues along cross streets were compounded by congestion at multiple intersections, making it infeasible to ascribe measured queue lengths to any isolated intersection. Therefore, the procedure established in the MLOU needed to be modified to achieve adequate calibration. The MLOU initially stated that “I-95/SR Off-Ramp queues at ramp terminal intersections will be calibrated to be within 20% difference between simulated and observed queue lengths.” This procedure was modified as follows: the maximum observed queue was collected as a reference to a physical feature in the field (e.g., I-95 Mainline/Ramp gore, adjacent intersection) instead.

In the Vissim model, a node was placed at the gore area where the Ives Dairy Road off-ramp diverges from the I-95 southbound mainline. The maximum queue length reported by Vissim does not extend beyond the upstream node. As displayed in Exhibit 18, the maximum queue length for the southbound left-turn movement is capped at the off-ramp length of 1,853 feet. This indicates that the maximum queue is anticipated to extend beyond the gore point. It should be noted that physical reference for the extent of queue from field observations and Vissim calibration results relate to maximum queues (i.e., not average). In addition, when the queues from exclusive turning lanes extended beyond the storage lengths, turning traffic gets mixed up with the through movement. Under these conditions, Vissim reports the same queue length for all the movements in the same approach. The following locations were observed to have queues over 25 vehicles:

- I-95 SB Off-Ramp @ Ives Dairy Road – Queues reach past the I-95 gore.
- Ives Dairy Road WB @ I-95 SB Ramps – Queues reach I-95 NB Ramps.
- I-95 NB Off-Ramps @ Ives Dairy Road – Queues past the turn lane storage to approximately halve way of the ramp length (does not reach I-95 gore).
- Ives Dairy Road EB @ I-95 NB Ramps – Queues reach I-95 SB Ramps.
- Ives Dairy Road WB @ I-95 NB Ramps – Queues reach Highland Lakes Boulevard.
- Ives Dairy Road EB @ Highland Lakes Boulevard – Queues reach I-95 NB Ramps.
- Highland Lakes Boulevard NB @ Ives Dairy Road – Queues reach NE 199th Street.
- Ives Dairy Road WB @ Highland Lakes Boulevard – Queues reach the westside of Highland Oaks Jr High School.
- Ives Dairy Road EB departure @ Highland Lakes Boulevard – Queues from the Highland Oaks Jr High School almost reach the intersection.
- I-95 SB Off-Ramp @ Miami Gardens Drive – Queues reach past the SB On-Ramp Loop (do not reach I-95 gore).
- I-95 NB Off-Ramp @ Miami Gardens Drive – Queues past the turn lane storage to approximately halve way of the ramp length (do not reach I-95 gore).
- NE 6th Avenue NB @ Miami Gardens Drive – Queues reach NE 177th Street.
- Miami Gardens Drive EB @ I-95 SB Off-Ramp – Queues past the turn lane storage.
- Miami Gardens Drive WB @ I-95 NB Ramp – Queues past the turn lane storage.

4.4 Summary

The calibrated model results for both existing AM and PM conditions indicate that calibration criteria including simulated volumes, simulated speeds, and visual observations are satisfied. Therefore, it can be concluded that the calibrated model reasonably depicts existing traffic operations, and it can be used to evaluate future alternatives.

Detector:	FLD6DOT095SB014.6-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	5
	FLD6DOT095SB014.6-DS-EL1
	FLD6DOT095SB014.6-DS-EL2
	FLD6DOT095SB014.6-DS-GP1
	FLD6DOT095SB014.6-DS-GP2
	FLD6DOT095SB014.6-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095SB015.1-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	5
	FLD6DOT095SB015.1-DS-EL1
	FLD6DOT095SB015.1-DS-EL2
	FLD6DOT095SB015.1-DS-GP1
	FLD6DOT095SB015.1-DS-GP2
	FLD6DOT095SB015.1-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095SB014.9-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	5
	FLD6DOT095SB014.9-DS-EL1
	FLD6DOT095SB014.9-DS-EL2
	FLD6DOT095SB014.9-DS-GP1
	FLD6DOT095SB014.9-DS-GP2
	FLD6DOT095SB014.9-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095SB015.2-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	5
	FLD6DOT095SB015.2-DS-EL1
	FLD6DOT095SB015.2-DS-EL2
	FLD6DOT095SB015.2-DS-GP1
	FLD6DOT095SB015.2-DS-GP2
	FLD6DOT095SB015.2-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095SB015.6-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	4
	FLD6DOT095SB015.6-DS-EL1
	FLD6DOT095SB015.6-DS-GP1
	FLD6DOT095SB015.6-DS-GP2
	FLD6DOT095SB015.6-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095SB017.0-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	7
	FLD6DOT095SB017.0-DS-EL1
	FLD6DOT095SB017.0-DS-GP1
	FLD6DOT095SB017.0-DS-GP2
	FLD6DOT095SB017.0-DS-GP3
	FLD6DOT095SB017.0-DS-GP4
	FLD6DOT095SB017.0-DS-GP5 - AUX
	FLD6DOT095SB017.0-DS-GP6 - AUX

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB014.0-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	4
	FLD6DOT095NB014.0-DS-EL1
	FLD6DOT095NB014.0-DS-GP1
	FLD6DOT095NB014.0-DS-GP2
	FLD6DOT095NB014.0-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB014.6-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	5
	FLD6DOT095NB014.6-DS-EL1
	FLD6DOT095NB014.6-DS-EL2
	FLD6DOT095NB014.6-DS-GP1
	FLD6DOT095NB014.6-DS-GP2
	FLD6DOT095NB014.6-DS-GP3

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB014.9-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	6
	FLD6DOT095NB014.9-DS-EL1
	FLD6DOT095NB014.9-DS-EL2
	FLD6DOT095NB014.9-DS-GP1
	FLD6DOT095NB014.9-DS-GP2
	FLD6DOT095NB014.9-DS-GP3
	FLD6DOT095NB014.9-DS-GP4

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB015.2-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	6
	FLD6DOT095NB015.2-DS-EL1
	FLD6DOT095NB015.2-DS-GP1
	FLD6DOT095NB015.2-DS-GP2
	FLD6DOT095NB015.2-DS-GP3
	FLD6DOT095NB015.2-DS-GP4
	FLD6DOT095NB015.2-DS-GP5

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB015.6-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	6
	FLD6DOT095NB015.6-DS-EL1
	FLD6DOT095NB015.6-DS-GP1
	FLD6DOT095NB015.6-DS-GP2
	FLD6DOT095NB015.6-DS-GP3
	FLD6DOT095NB015.6-DS-GP4
	FLD6DOT095NB015.6-DS-GP5

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

Detector:	FLD6DOT095NB017.0-DS
Date Range:	2021-09-21 00:00:00 - 2021-09-24 00:00:00
Report Interval:	15
Detector Lane Number:	6
	FLD6DOT095NB017.0-DS-EL1
	FLD6DOT095NB017.0-DS-GP1
	FLD6DOT095NB017.0-DS-GP2
	FLD6DOT095NB017.0-DS-GP3
	FLD6DOT095NB017.0-DS-GP4
	FLD6DOT095NB017.0-DS-GP5

The number to the right of DS-EL and DS-GP corresponds to the lane number (e.g., FLD6DOT095NB015.2-DS-GP2). Lanes are numbered from left to right (in the direction of traffic), starting from the median.

SIGNALIZATION NOTES

1. CONTRACTOR TO USE EXISTING CONDUITS AND PULL BOXES TO RUN NEW LOOP HOME-RUN CABLE AND SIGNAL CABLE TO EXISTING CONTROLLER CABINET
2. MAJOR STREET IS IVES DAIRY RD (EASTBOUND & WESTBOUND) MINOR STREET IS I-95 RAMP (SOUTHBOUND)
3. CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING THE EXISTING CONDUITS, PULL BOXES, NEW CONDUIT ENTRY INTO EXISTING CABINET FOR LOOP REPLACEMENT AND PEDESTRIAN SIGNALS INSTALLATION.
4. PROTECTED ONLY LEFT TURN FOR MOVEMENT 5
5. FLASHING OPERATION TO BE YELLOW FOR IVES DAIRY ROAD AND RED FOR I-95 RAMP AND WESTBOUND LEFT-TURN
6. INTERSECTION RE-WIRE SHALL BE PAID FOR UNDER PAY ITEM NUMBER:
   632-7-1 1 PI
7. PAY ITEM NO. 690-100 INCLUDES REMOVAL OF ABANDONED PULL BOXES AND EXISTING LOOP LEAD-INS.
8. NEW SIGNAL HEADS ON EXISTING MAST ARMS SHALL NOT INCLUDE SIGNAL BACKPLATES.
9. CONTROLLER TIMINGS TO BE PROVIDED BY MIAMI-DADE COUNTY.
10. STEEL LINE LOCATED UNDER PROPOSED MAST ARM 1 IS NO LONGER IN SERVICE.
11. INSTALL ADDITIONAL LOOP DETECTOR IN CABINET IF NECESSARY.
12. LOCATION OF AT&T SERVICE POINT AND POWER SERVICE POINT TO BE PROVIDED IN THE AS-BUILT PLANS.

Peak Hours (8 - 9 AM) and (4 - 5 PM):

Location 1 – Between Hallandale Beach Boulevard and Ives Dairy Road and Express Lanes Ingress/Egress (FLD6DOT095SB017.0 / FLD6DOT095NB017.0)

Location 2 – Between Ives Dairy Road and Express Lanes Ingress/Egress (FLD6DOT095SB015.6 / FLD6DOT095NB015.6)

Location 3 – Between Ives Dairy Road and Miami Gardens Drive & Between Express Lanes Ingress/Egress (FLD6DOT095SB015.2 / FLD6DOT095NB015.2)

Location 4 – Between Express Lanes Ingress/Egress and Miami Gardens Drive (FLD6DOT095SB014.9 / FLD6DOT095NB014.9)

Location 5 – Between Miami Gardens Drive Ramps (FLD6DOT095SB014.6 / FLD6DOT095NB014.6)

Location 6 – Between Miami Gardens Drive and Golden Glades Interchange (FLD6DOT095SB014.0 / FLD6DOT095NB014.0)

Location 7 – Between Express Lanes Ingress/Egress and Miami Gardens Drive (FLD6DOT095SB015.1)

Intersection Summary	
Cycle Length: 130	
Actuated Cycle Length: 130	
Offset: 120 (92%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green	
Control Type: Actuated-Coordinated	
Maximum v/c Ratio: 1.58	
Intersection Signal Delay (s/veh): 29.9	Intersection LOS: C
Intersection Capacity Utilization 80.5%	ICU Level of Service D
Analysis Period (min) 15	

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 102: Ives Dairy Rd & NE 16th Ave
